L. *dies solis*): AS. *sunnan*, gen. of *sunne*, sun; *dæg*, day; see *sun*<sup>1</sup> and *day*<sup>1</sup>.] **I. n.** The first day of the week; the Christian Sabbath; the Lord's Day. See *Sabbath*.

The name *Sunday*, or 'day of the Sun,' belongs to the first day of the week on astronomical grounds, and has long been so used, from far beyond the Christian era, and far outside of Christian countries. (See *week*.) The ordinary name of the day in Christian Greek and Latin and in the Romanic languages is the *Lord's Day* (Greek *κυριακή*, Latin *dominica*, French *dimanche*, etc.), while the Germanic languages, including English, call it *Sunday*. In the calendar of the Roman Catholic and Anglican churches the Sundays of the year form two series—one reckoned from Christmas, and one from Easter. The first series consists of four Sundays in Advent, one or two Sundays after Christmas, and the Sundays after Epiphany, from one to six in number, according to the date of Septuagesima. The second series consists of the remaining Sundays of the year—namely, Septuagesima, Sexagesima, Quinquagesima, six Sundays in Lent, Easter Sunday, five Sundays after Easter, Sunday after Ascension, Pentecost or Whitsunday, and the Sundays after Pentecost (the first of which is Trinity Sunday), from twenty-three to twenty-eight in number, or the Sundays after Trinity (according to the usage of the Anglican Church), from twenty-two to twenty-seven in number, the last of these being always the Sunday next before Advent. On the Sundays after Pentecost or Trinity not provided with offices of their own are used the offices of the Sundays omitted after Epiphany. In the Greek Church the first Sunday of the ecclesiastical year is the Sunday of the Publican and Pharisee, which is that next before Septuagesima. Then follow the Sundays of the Prodigal Son, of Apocryphus, of Tyrophagus, the six Sundays of Lent, Easter, (called *Pascha* or *Bright Sunday*), the five Sundays after Easter (called of St. Thomas or *Antipascha*, of the Gnat-bearers, of the Paralytic, of the Samaritan Woman or *Mid-Pentecost*, of the Blind Man), the Sunday after Ascension, (called of the Three Hundred and Eighty Fathers of Nicaea), Pentecost, and All Saints' Sunday, answering to Trinity Sunday. The Sundays after Pentecost are numbered continuously till the Sunday of the Publican and Pharisee is again reached. They are mostly named after the evangelist from whom the gospel for the day is taken. They are called *Sundays of St. Matthew* from Pentecost till the Exaltation of the Cross (September 14th), when two Sundays are called *Sunday before* and *after the Exaltation* respectively. After this follow the *Sundays of St. Luke*. The Sundays corresponding to the third and fourth in Advent are the Sunday of the Holy Forefathers and the Sunday before Christmas, and the Sundays next preceding and succeeding the Epiphany are called *Sunday before* and *after the Lights*. Some Sundays of St. Matthew, if omitted before the Exaltation, are transferred to the time after the Epiphany. The seventeenth or last Sunday of St. Matthew is called the *Sunday of the Canaanish Woman*.

The best-known of these is *D. rotundifolia*, the round-leaved sundew of both continents, having small white flowers. (See cut under *Drosera*.) *D. filiformis*, the thread-leaved sundew, is a beautiful plant of wet sands near the Atlantic coast of the United States. **sun-dial** (sun'di'al), *n.* [*Early mod. E.* also *sunne-dial*; < *sun*<sup>1</sup> + *dial*.] An instrument for indicating the time of day by means of the position of a shadow on a dial or diagram. The shadow used is generally the edge of a gnomon, which edge must be parallel to the earth's axis, about which the sun revolves uniformly in consequence of the earth's diurnal rotation. If a series of imaginary planes through the edge (one in the meridian and the others inclined to one another by successive multiples of 15°) be cut by the plane of the dial, the intersecting lines will be in the positions of the hour-lines of the dial. The shadow of any given point upon the gnomon-edge will fall at different positions on the hour-line according to the declination of the sun, and this circumstance may be used to make the dial show mean instead of apparent time. But this is inconvenient, and seldom used. Portable sun-dials used often to be made so that their indications depended exclusively on the altitude of the sun; such dials require adjustment for the time of the year. See *dial*. — To rectify a sun-dial. See *rectify*.

**sunshine-recorder** (sun'shīn-rē-kōr'dēr), *n.* An instrument for registering the duration of sunshine. Two principal forms have come into use, one utilizing the heating effect, the other the actinic effect, of the sun's rays. The Campbell sunshine-recorder consists of a glass sphere which acts as a lens, with its focus on a curved strip of millboard. The sun's rays, focused by the sphere, burn a path on the millboard as the sun moves through the heavens. The length of the burnt line indicates the duration of sunshine, or, more strictly, the length of time that the sun shines with sufficient intensity to burn the millboard. The photographic sunshine-recorder consists of a dark chamber into which a ray of light is admitted through a pinhole. This ray falls on a strip of sensitized paper which is placed on the inside of a cylinder whose axis is perpendicular to the sun's rays. Under the diurnal motion of the sun, the ray travels across the paper, and leaves a sharp straight line of chemical action, while no other part of the paper is exposed to light. The axis of the cylinder has an adjustment for latitude. In the latest form of the apparatus two cylinders are used, one for the morning and the other for the afternoon trace.

**sun-spot** (sun'spōt), *n.* One of the dark patches, from 1,000 to 100,000 miles in diameter, which are often visible upon the photosphere. The central part, or umbra, appears nearly black, though the darkness is really only relative to the intense surrounding brightness. With proper appliances the umbra itself is seen to contain still darker circular holes, and to be overlaid by films of transparent cloud. It is ordinarily surrounded by a nearly concentric penumbra composed of converging filaments. Often, however, the penumbra is unsymmetrical with respect to the umbra, and sometimes it is entirely wanting. The spots often appear in groups, and frequently a large one breaks up into smaller ones. They are continually changing in form and dimensions, and sometimes have a distinct drift upon the sun's sur-

face. They last from a few hours to many months. They are known to be shallow cavities in the photosphere, depressed several hundred miles below the general level, and owe their darkness mainly to the absorption of light due to the cooler vapors which fill them. Their cause and the precise theory of their formation are still uncertain, though it is more than probable that they are in some way

connected with descending currents from the upper regions of the solar atmosphere. The spots are limited to the region within 45° of the sun's equator, and are most numerous in latitudes from 15° to 20°, being rather scarce on the equator itself. They exhibit a marked periodicity in number: at intervals of about eleven years they are abundant, while at intermediate times they almost vanish. The explanation of this periodicity is still unknown. Numerous attempts have been made to correlate it with various periodic phenomena upon the earth—with doubtful success, however, except that there is an unmistakable (though unexplained) connection between the spottedness of the sun's surface and the number and violence of our so-called magnetic storms and auroras.

In the following extract *supernatural* is used in the sense ordinarily expressed by *extra-natural* or *miraculous*.

That is *supernatural*, whatever it be, that is either not in the chain of natural cause and effect, or which acts on the chain of cause and effect, in nature, from without the chain.

The raising of the dead to life would be *miraculous*, because, if brought about by a law of nature, it would be by a law outside of and above any that are known to man, and perhaps overruling some law or laws of nature. *Preternatural* is used especially to note that which might have been a work of nature, but is not. That which is *superhuman* is above the nature or powers of man. *Superhuman* is often used by hyperbole to note that which is very remarkable in man: as, he exhibited *superhuman* strength; the other words may be similarly used in a lower sense.

**II. n.** That which is above or beyond the established course or laws of nature; something transcending nature; supernatural agencies, influence, phenomena, etc.: with the definite article.

As in the case of *religio* (*n.*), *religio* (*n.*), religion (see *religion*), the exact original sense of *superstitio* (*n.*) is uncertain; it is supposed to have been a 'standing over something' in amazement or awe. The explanation (reflected, e. g., in the quot. from Lowell, below) that it means lit. 'a survival' (namely, of savage or barbarous beliefs generally outgrown) is modern, and is entirely foreign to Roman thought.] 1. An ignorant or irrational fear of that which is unknown or mysterious; especially, such fear of some invisible existence or existences; specifically, religious belief or practice, or both, founded on irrational fear or credulity; excessive or unreasonable religious scruples produced by credulous fears.

= Syn. 1-3. *Superstition*, *Credulity*, *Fanaticism*, *Bigotry*. *Credulity* is a general readiness to believe what one is told, without sufficient evidence. *Superstition* may be the result of credulity in regard to religious beliefs or duties or as to the supernatural. As compared with *fanaticism* it is a state of fears on the one side and rigorous observances on the other, both proceeding from an oppression of the mind by its beliefs, while *fanaticism* is too highly wrought in its excitement for fear or for attention to details of conduct. *Fanaticism* is a half-crazy substitution of fancies for reason, primarily in the field of religion, but secondarily in politics, etc. *Fanaticism* is demonstrative, being often ready to undertake, in obedience to its supposed duty or call by special revelation, tasks that are commonly considered wicked or treated as criminal. *Bigotry* is less a matter of action; subjectively it is a blind refusal to entertain the idea of correctness or excellence in religious opinions or practices other than one's own; objectively it is an attitude matching such a state of mind. *Credulity* is opposed to skepticism, *superstition* to irreverence, *fanaticism* to indifference, *bigotry* to latitudinarianism.

Moreover, to suppose is to set up a proposition in order to trace its consequences, while imagining involves no such ulterior purpose.

**surface** (sêr'fās), *n.* and *a.* [*< OF. (and F.)*  
*surface*, *< sur- + face*, face; taking the place

top, surface: see *superficies*.] 1. n. 1. The  
bounding or limiting parts of a body; the parts

coloured, but even this was not considered so important  
as the paintings which covered the flat *surfaces* of the  
walls.

*J. Ferguson, Hist. Arch.*, I. 370.

2. The boundary between two solid spaces not  
adjacent to a third; distinguished as a *math-*  
*ematical surface*. A surface is a geometrical locus de-  
fined by a single general and continuous condition. This  
condition reduces the points of the surface to a two-  
dimensional continuum, its enveloping planes to a two-  
dimensional continuum, and its enveloping straight lines  
to a three-dimensional continuum. A solid surface ap-  
pears to be enveloped by a one-dimensional series of  
lines; but when imaginary points are considered, this is  
seen not to be so. A true one-dimensional continuum  
of lines requires for its determination a threefold condition,  
and can contain but a finite number (or discrete infinity)  
of points and of planes. The number of point-set planes  
of a surface which satisfy a twofold additional condition,  
as that the points shall lie upon a given line, or that the  
planes shall contain a given line, and the number of lines  
of the surface which satisfy a threefold additional con-  
dition, as that they shall belong to a given plane pencil,  
are either finite or only discrete infinity. In the former  
case the surface is said to be *algebraical*, in the latter  
*transcendental*. If the imaginary elements are taken into  
account, the numbers are constant whatever the special  
lines or pencils to which they refer may be. The number  
of points of an algebraical surface which lie upon a given  
straight line is called the *order* of the surface; the num-  
ber of tangent planes which contain a given line is called  
the *class* of the surface; and the number of tangent lines  
which belong to a given plane pencil is called the *rank* of  
the surface.

3. Outward or external appearance; what ap-  
pears on a slight view or without examination.

The two surfaces are minimal surfaces having their tangent planes at corresponding points parallel.—**Augmented surface.** See *augment*.—**Bonnet's surface,** a minimal surface spherically represented by two families of circles, its equations being

where  $\lambda$  and  $\mu$  are the parameters of the lines of curvature, and  $\lambda$  is constant. Its section by the planes of XY shows an infinite series of equal catenaries having their bases parallel to Y. See *developable*.—**Diagonal surface,** a special surface of the third order.—**Dianodal, dorsal, equal, equipotential surface.** See the adjectives.—**Double surface,** a surface the locus of the middle of chords of a minimal curve or imaginary curve every tangent of which touches the absolute circle. It is a minimal surface.—**Doubly connected surface,** a ring-shaped surface, one on which it is possible to draw an oval so that a point may move from the outside to the inside without traversing the curve (more accurately speaking, the oval has no distinction of inside and outside); but after one such oval is drawn it is impossible to draw another not intersecting the first.—**Elassoidal surface,** a surface whose mean curvature is nothing: same as *minimal surface*, in the sense in which the latter is commonly used.—**Enneper's surface** [invented by A. Enneper in 1864], a surface of constant curvature, but not of revolution, of which one set of lines of curvature are plane or spherical.—**Equatorial surface,** a complex surface having its nodal line at infinity.—**Eroded surface.** See *erode*.—**Family of surfaces,** in *math.*, all the surfaces which are generated by a curve of a general kind moving in a general way.—**Flattened surface,** a surface consisting of a multiple plane with nodal curves and points.—**Focal surface,** a surface having the lines of a primitive congruence as bitangents. Henneberg in 1875], a double elassoidal surface of the fifth class.—**Hessian surface** [named after Dr. Otto Hesse; see *Hessian*], the locus of points whose polar quadrics relatively to a primitive surface are cones. $$\left( \frac{xd}{dx} + \frac{yd}{dy} + \frac{zd}{dz} \right)^2 \phi =$$

$$\begin{aligned}& \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ (dx)^2 & dy dx & dz dx \end{vmatrix} \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ (dx)^2 & dy dx & dz dx \end{vmatrix} \\& - \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ dx dy & (dy)^2 & dz dy \end{vmatrix} \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ dx dy & (dy)^2 & dz dy \end{vmatrix} \\& + \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ dx dz & dy dz & (dz)^2 \end{vmatrix} \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ dx dz & dy dz & (dz)^2 \end{vmatrix} \\& - \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ dx dz & dy dz & (dz)^2 \end{vmatrix} \begin{vmatrix} d^2\phi & d^2\phi & d^2\phi \\ dx dz & dy dz & (dz)^2 \end{vmatrix} = 0\end{aligned}$$

(b) The surface often originally, and better, called the *Roman surface* [discovered by Jacob Steiner (1796-1863)], undoubtedly the greatest of all geometricians, being a quartic surface of the third class, having three double lines. In its symmetrical form its appearance is thus described: Take a tetrahedron, and inscribe in each face a circle. There will be, of course, two circles touching at the mid-point of each edge of the tetrahedron; each circle will contain, on its circumference, at angular distances of 120°, three mid-points; and the lines joining these with the center of the tetrahedron, produced beyond the center, meet the opposite edges. . . . Joining the mid-points. . . . Now truncate the tetrahedron by planes parallel to the faces, so as to reduce the altitudes, each to three fourths of the original value; and from the center of each new face round off symmetrically up to the adjacent three circles; and within each circle scoop down to the center of the tetrahedron, the bounding surface of the excavation passing through [that is, containing] the three right lines, and the sections by planes parallel to the face being in the neighborhood of the face nearly circular, but, as they approach the center, assuming a trigonal form, and being close to the center an indefinitely small equilateral triangle. We have thus the surface, consisting of four lobes united only by the lines through the mid-points of opposite edges—these lines being consequently nodal lines, the mid-points being pinch-points of the surface, and the faces singular planes, each touching the surface along the inscribed circle. Soc.*, V, 14).—**Surface of aberration,** the ruled surface described in a year by the line of apparent direction of a star as affected by aberration.—**Surface of centers.** See *center*.—**Surface of discontinuity,** a vortex sheet within a fluid over which slipping takes place.—**Surface of equal head.** See *head*.—**Surface of revolution,** a surface which is generated by the revolution of a curve round an axis.—**Surface of translation.** (a) A cylindrical surface. **surplice** (sér'plis), *n.* [Early mod. E. also *surplis*; < ME. *surplis*, *surplige*, *surplis*, < OF. *surplis*, *surpeliz*, *surpelis*, *surpells*, F. *surplis* = Pr. *sobrepliz* = Sp. *sobrepliz* = Pg. *sobrepliz* = It. *superpelliceo*, < ML. *superpellicum*, a surplice, < L. *super*, over, + ML. *\*pellicum*, *pellicia*, a garment of fur, a pelisse, < L. *pellicus*, made of skins, < *pellis*, a skin: see *peliss*, *pilet*.] A loose-fitting vestment of white linen, with broad and full sleeves, worn over the cassock by clergymen and choristers in the Roman Catholic and Anglican churches. It is worn at almost all offices except when replaced by the alb. In England it is also worn on certain days known as *surplice-days* by the fellows and students at the universities of Oxford and Cambridge. The surplice was originally a variety of the alb, differing from it by the greater fullness of the sleeves. Early representations of the alb show, however, that it was often nearly as full in shape as the surplice. The name *surplice* (*superpellicium*) first occurs in the eleventh century, and was derived from the practice of wearing this vestment over a pelisse, or dress of fur—a circumstance which also explains its great breadth and fullness. In its more ancient form the surplice reached the feet, and it retained till recently nearly its full length. At present, in the Anglican Church, it reaches to the knee or lower, while in the Roman Catholic Church it is usually much shorter than this and is ornamented with lace or is made of lace-like lawn or other material. The short or Italian surplice, especially as worn by choristers, is called a *cotta*. See *rochet*!.

**Sutra** (sō'trā), *n.* [= F. *soutra*, *< Skt. sūtra*, lit. a thread, string, *< √ siv*, sew, cf. *L. suere* = E. *sew*<sup>1</sup>: see *sew*<sup>1</sup>.] In Sanskrit lit., a body of rules or precepts. In Brahmanic use, applied especially to collections of three classes: (1) *grānta-sūtras*, directions concerning the more elaborate and important ceremonies; (2) *grhya-sūtras*, concerning minor or household rites and practices; (3) *dharma-sūtras*, concerning the conduct of life, the duties of the castes, etc. The first two are reckoned as part of the Veda. In Buddhist literature, applied to general expositions of doctrine, the sermons of Buddha, etc., constituting the second of the three principal divisions.

**sutt** (sut), *n.* [Origin obscure.] A species of sea-bird. Whiteaves. [Gulf of St. Lawrence.]  
**suttee** (su-tē'), *n.* [Also, better, *sati*; F. *suttie*, *suttee* (*< E.*), *< Hind. sati*, a faithful wife, esp. one who burns herself on the funeral pile of her husband; hence also the burning itself; *Skt. sati*, fem. of *sant*, existing, true, virtuous, abbr. from *\*asant*, ppr. of *√ as*, be, exist: see *am*, *is*, *sooth*.] 1. A Hindu widow who immolates herself on the funeral pile, either with the body of her husband, or separately if he died at a distance. — 2. The voluntary self-immolation

of Hindu widows on the funeral pile of their husbands according to a Brahmanical rite. The custom is not known or commanded in the most ancient sacred books of the Hindus, but is early spoken of as highly meritorious. The practice is now abolished in British India, and is all but extinct in the native states.

One of the first acts of the Dharmasabha was to petition Government against the abolition of *Suttee*—that is, in favour of the continuance of the burning of widows.

Max Müller, Biograph. Essays, p. 25.

The sense of 'dirty work' seems to come from the notion of 'wet' involved in *sod*<sup>1</sup>, *suds*, etc.] To peddle; act as sutler.

*Soetelen*, to sullivan, to suttle [var. *sutle*, ed. 1678] or to victual. Hexham, Netherdutch and Eng. Dict. (1658).

**suttl**<sup>3</sup> (sut'l), *a.* [Perhaps *< It. sottile*, *sottile*, fine, subtle: see *suttl*<sup>1</sup>, now *suttl*.] Light; in the light weight previous to the additional goods delivered for tret. Since tret went out of use, very long ago, though continued in the arithmetic books, it has come to be wrongly stated to be a deduction, instead of an addition not to the number of pounds but to the amount of goods delivered; and *suttl* is sometimes erroneously called a noun.

At 16 pound the 100 *suttl*, what shall 895 pound *suttl* be worth, in giving 4 pound weight upon every 100 for tret. Mellis, Rules of Practice (before 1600), viii.

2. A line of joining, uniting, or closure as if by sewing, stitching, or knitting together; a seam; a raphe. Specifically—(a) In *anat.*, a linear synarthrosis or immovable articulation, especially of the bones of the skull. In man and other mammals all the cranial bones excepting the lower jaw are united by joints technically called sutures, and in all vertebrates which have bony skulls the sutures are numerous, uniting most of the bones. Sutures are classified or described in various ways: (1) by the mode of apposition of the united surfaces or edges of the bones, as the *equimarginal* suture, the *harmonic* suture, the *dentate*, the *limbate*, etc. (see *squarthritis*); (2) by the shape or position of the suture, as the *coronal*, *sagittal*, *lambdoid* suture (many of these sutures appear in the cuts under *cranium* and *skull*, and in most of the other skulls figured in this dictionary); (3) by the names of the two bones which are sutured, as the *frontoparietal*, *occipitoparietal*, *sphenoparietal* suture. See phrases following. (b) In *entom.*, the line along which the elytra of opposite sides meet and sometimes are confluent. (c) In *conch.*, the line of junction of the successive whorls of a univalve shell, or the line of closure of the opposite valves of a bivalve shell. (d) In *cephalopods*, the outline of the septa of the tetrabranchiata, which resemble in some respects the dentate sutures of the cranial bones. These lines are variously traced in different cases; when they are folded the elevations or saliences are called *saddles*, and the intervening depressions or reentrances are called *lobes*.

3. In *bot.*, the seam or line of junction between two edges, as between the component carpels

of a pericarp, there commonly marking the line of dehiscence. — 4. In *surg.*: (a) The uniting of the lips or edges of a wound by stitching or stitches, or in some equivalent manner. (b) One of the stitches or fastenings used to make such a union of the lips of a wound.

This was excised from the cartilage, and the lips of the cut partly approximated by two metallic sutures.

In adult man it is usually obliterated by confluence of the bones: when it persists, it continues the line of the sagittal suture down the middle of the forehead to the root of the nose. More accurately called *interfrontal suture*. (b) In *entom.*, same as *clypeal suture*. — **Frontoparietal suture,** the coronal suture. — **Frontosphenoid suture,** the suture between the frontal and sphenoid bones, chiefly the line of apposition of each orbital plate of the frontal with the corresponding orbitosphenoid. — **Genal suture.** See *genal*. — **Great suture.** Same as *genal suture*. — **Gular sutures.** Same as *buccal sutures*. — **Harmonic suture,** suture by means of flat rough surfaces apposed without beveling: a variety of false suture. — **Interfrontal suture,** the frontal suture. — **Intermaxillary suture,** the harmonic suture between the right and left superior maxillary bones, effected chiefly by their palatal plates and alveolar borders. — **Internasal suture,** the suture between the right and left nasal bones. — **Interparietal suture,** the sagittal suture. — **Lambdoid suture,** the occipitoparietal suture: so called because in man it presents the shape of the Greek capital letter lambda (λ). It is noted for its irregular zigzag course and deep dentations, often including Wormian bones. — **Limbose suture,** a suture with beveled edges and toothed processes, as the coronal or frontoparietal of man. — **Mastoid suture,** the suture between the mastoid part of the temporal bone and the occipital. — **Mastoparietal suture,** the suture between the mastoid part of the temporal bone and the parietal: it is short and deeply dentated in man, and non-existent in most animals. — **Mental, metopic, nasal, neurocentral suture.** See the adjectives. — **Occipitoparietal suture,** the lambdoid suture. — **Palatine, parietomastoid, parieto-occipital suture.** See the adjectives. — **Parietosquamosal suture,** the suture between the parietal bone and the squamous part of the temporal bone. — **Parietotemporal suture,** the suture between the parietal and temporal bones. — **Petroccipital suture,** the suture between the petrous part of the temporal bone and the occipital: in man it is irregular and incomplete, interrupted by the posterior lacerate foramen. — **Petrosphenoid suture,** the suture between the petrous part of the temporal and the greater wing of the sphenoid bone; the suture between the petrosal and alisphenoid. — **Petrosquamosal suture.** See *petrosquamosal*. — **Prosternal sutures.** See *prosternal*. — **Quilled suture,** in

The upper portion of gut is invaginated in the lower, and secured by a single point of suture, which also attaches the intestine to the abdominal wound. — **Sagittal, serrate, sphenofrontal suture.** See the adjectives. — **Sphenomalar suture,** the suture between the malar and any part of the sphenoid. It is a rare articulation, occasional in man. — **Sphenopalatine suture,** the suture of the palate bone with the sphenoid. — **Sphenoparietal suture,** the suture between the parietal and alisphenoid bones. — **Sphenopetrosal suture,** the suture between the sphenoid and the petrous part of the temporal bone. — **Sphenotemporal suture,** the suture between the sphenoid and temporal bones. — **Squamosphenoid suture,** the suture between the squamosal and sphenoid bones. — **Squamous suture.** See *squamous*. — **Temporal suture.** Same as *petrosquamosal suture*. — **Transverse suture,** of man, the series of articulations of the frontal bone with the sphenoid, ethmoid, and several facial bones, extending entirely across the upper part of the face, nearly on a level with the roof of the orbits of the eyes. The bones thus sutured with the frontal are the ethmoid and sphenoid in mid-line, and the nasal, lacrymal, malar, and superior maxillary on each side. — **True suture,** suture by indented borders of bones, as in the dentate, serrate, and limbose sutures. Compare *false suture*, above.

They have odd-pinnate leaves of many entire leaflets, commonly with broad leaf-like stipules, and bluish, purplish, or red, rarely white or yellowish flowers in axillary racemes. Several species are cultivated under the name *Swainson pea*; especially two species with large pink or red flowers, *S. **swallow**<sup>2</sup> (swol'ô), *n.* [ME. *swelowe*, *swolve*, *swelowe*, *sweloug*, *swolug*, *swolg*, *swalg* = I. G. *swaly*, G. *schwaly* = Icel. *swelgr* = Sw. *swalg* = Dan. *swalg*, the gullet, a gulf, whirlpool; from the verb: see *swallow*<sup>1</sup>, *v.* orig. Tent. *\*swelgan*, perhaps = Gr. *swelgan* (written also *swelgan*, and erroneously associated with *swel*, *swel*, a large-fish: see *swelgan*).] 1. A fissirostral oscine passerine bird with nine primaries; any member of the family *Hirundinidae*, of which there are numerous genera and about 100 species, found in all parts of the world. The leading species of swallows are the barn swallows of the genus *Hirundo*, with long deeply forked tail having the lateral feathers elongated and linear toward their ends, and with lustrous steel-blue plumage on the upper parts, and more or less rufous plumage below. The common bird of Europe is *H. rustica*, that of America is *H. erythrogastra*. They are called *barn-swallows* because they usually build their nests of straw and mud on the rafters of barns. The house-swallow or martin of Europe is *H. urbica*, of a genus not presented in America. The purple martin of North America is a very large swallow, *P. subul* or *P. purpurea*, the male of which is entirely lustrous steel-blue; several similar species of the same genus inhabit other parts of America. The most widely diffused species of the family is the bank swallow or sand martin, *Icthyophaga* or *Icthyophaga riparia*, common to both hemispheres, of a mossy-gray and white coloration, without lustre, breeding in holes in banks. Cliff-swallows are several species of the genus *Petrochelidon*, found in various parts of the world. That of the United States is *P. lunifrons*, also called *republican swallow*, *mont swallow*, and *crissal-swallow*. The seabird nests almost entirely of pellets of mud stuck together in masses on the sides of cliffs, under eaves, etc. Rough-winged swallows are several forms of the genera *Psalidoprocne* and *Stelidoprocne*, as *S. serripennis* of the United States, having the outer web of the first primary serrate with a series of recurved hooks. It is of dull-grayish coloration, resembling the bank-swallow. The white-bellied swallow of the United States is *Tachycineta* or *tridactyla*, of a lustrous greenish-black above and snowy-white below. A still more beautiful related species is the violet-green swallow of western North America, *Tachycineta thalassina*. The Bahama-swallow, *Cathartodon cyanicollis*, is a beautiful swallow resembling the violet-green, with sheeny upper parts and white under parts, belonging to the Bahamas and rarely found in Florida. Swallows are mainly insectivorous birds (though some of them eat berries also), and usually capture their prey on the wing with great address. Their wings are long, pointed, and narrow-bladed, giving great buoyancy, speed, and extension of flight. The feet are small and weak, and scarcely used for progression, but chiefly for perching and clinging. The song is a varied and voluble twittering, but the American martin has a strong, rich, musical note. Swallows are in most countries migratory; and those of Europe and America have long been noted, not only for the extent, but also for the regularity, of their migratory movements. Each species has its regular time of appearing in the spring which may be predicted with much confidence; it is, however, to some extent dependent upon the weather, or the general advancement or retardation of the opening of the season. In the autumn

White-bellied Swallow (*Tachycineta thalassina*)

swallows are often found in leaving their summer resorts by the approach of storms or cold weather, and they are thus to some extent weather-prophets. Their modes of nesting are more variable than is usually the case among birds so intimately related in other habits and in structure; and swallows also show to an extent unequalled by other birds, a readiness to modify their primitive nesting habits in populous regions. Thus, the nidification of the seven species of swallows which are common in the United States shows four distinct categories: (1) holes in the ground, dug by the birds, slightly furnished with soft materials: bank-swallow, rough-winged swallow; (2) holes in trees or rocks, not made by the birds, fairly furnished with soft materials: white-bellied and violet-green swallows and purple martin; (3) holes or their equivalents, not made by the birds, but secured through human agency, and

more or less furnished with soft materials by the birds: formerly the species now six of the seven species of bank-swallow; the barn-swallow; (4) nests of mud, constructed by the birds, plastered with mud, and furnished with a hole, slightly furnished with soft materials: the house-swallow and the bank-swallow; (5) nests of mud, constructed by the birds, plastered with mud, and furnished with a hole, slightly furnished with soft materials: the purple martin, some house-swallow, and the barn-swallow. Among species in the United States, the white-bellied swallow and the cliff-swallow lay the earliest eggs, the white-bellied swallow. This difference in the time taken in connection with the mode of nesting, and the general rule with birds that breed in holes by early eggs, and that nest-builders, especially those who build in cavities of stone and open, lay later eggs. See also the house-swallow, the barn-swallow, the bank-swallow, the purple martin, the rough-winged swallow, and the cliff-swallow.

2. Some birds likened to or mistaken for a swallow. Thus, the swifts, *Cephalotes*, belonging to a different order of birds, are commonly misnamed as the house-swallow of the United States, *Charbona pelagica*. See also under *Charbona*. **Swartzia** (swärt'si-ä), *n.* [NL. (Schreber, 1789), named after Olaus *Swartz* (born 1760, died about 1818), a Swedish botanist.] A genus of leguminous trees, of the suborder *Papilionaceæ*, type of the tribe *Swartzia*. It is characterized by a variously ruptured calyx, which is entire and roundish in the bud; a corolla usually consisting of a single broad corrugated banner-petal or sometimes wanting, numerous declined and curving stamens which are nearly or quite free, and a coraceous or fleshy avoid or elongated pod. There are nearly 60 species, natives of tropical America, except one which is African. The leaves are odd pinnate or sometimes reduced to a single leaflet. The flowers are commonly borne in clustered or panicle racemes. They are mostly large forest-trees yielding a very hard and durable timber. *S. tomentosa*, the panococo or palo santo tree of Cuba, becomes so tall and so fast that its bark, called *panococo*, is a powerful sudorific, and yields a red juice which hardens into a blackish resin. *S. grandiflora*, of the West Indies and southward, a small tree or shrub known as *unroble*, *amarillo*, also yields a valuable and very heavy wood.

P. de Candolle, 1825), *< Swartzia + -ia*.] A tribe of leguminous plants, intermediate between the suborder *Cesalpiniæ* and the *Papilionaceæ*, and formerly itself regarded as a distinct suborder. From the former it differs in its usually exterior upper petal and its inflexed instead of straight radicle. It is now classed with the *Papilionaceæ*, but differs from their usual character in its numerous and separate stamens, and corolla not at all papilionaceous but composed of five nearly equal petals, or of a single broad one or wholly without petals. From the tribe *Sophoreæ*, its nearest ally, it is also distinguished by its calyx, which is closed and entire in the bud. It consists of 6 genera, of which *Swartzia* is the type, and includes about 70 species, mainly trees with pinnate leaves, natives of tropical Africa and South America, especially of Brazil. Five or six exceptional Brazilian species have usually only ten stamens, like the type of the order.

II. *n.* A believer in the theology and religious doctrines of Swedenborg; a New Churchman. Swedenborg held Rev. xxi. 2, "And I John saw the holy city, new Jerusalem, coming down from God out of heaven," to be a prediction of the establishment of a new dispensation, the initiation of which took place by the execution of the last judgment in the spiritual world in the year 1757, whereby man was restored to moral freedom by the restriction of evil infestations, the power of which had threatened its utter extinction. In proof of this belief, his followers point to the unparalleled spiritual and material progress of mankind since that date. They were first organized in London (where Swedenborg long resided) in 1788, under the name of the "Society of the New Church signified by the New Jerusalem," usually abbreviated to New Church. Professed Swedenborgians, though widely scattered, have never been numerous; but Swedenborg himself appears not to have contemplated the formation of a separate church, trusting to the permeation of his doctrines through the existing churches. Swedenborgians believe that this process is going on, and that thus the new dispensation is making its way independently of their own organization or efforts, and even without the conscious knowledge of most of those affected by it. Swedenborg considered himself the divinely appointed herald and expounder of this dispensation, being prepared for the office by open intercourse during many years with spirits and angels (all originally human beings), and with God himself, who revealed to him the spiritual or symbolic sense of the Divine Word (which the world had not previously been in a state to receive or apprehend), setting forth spiritual and celestial truths in every part through the correspondence of all material things with the spiritual principles, good or evil, of which they are the outgrowth and manifestation. This doctrine of correspondences is the foundation of his system, which he elaborated with uniform consistency in many volumes, all first published in Latin. In this correspondence consists the planetary inspiration of the Word, which includes only the Pentateuch, Joshua, Judges, Samuel, Kings, the Prophets and Psalms, the four Gospels, and the Apocalypse; the other books of the Bible are valuable for instruction, but lack this divine character.

2. To move on or in water by natural means of locomotion, as an animal, many of which can so move, though the water be not their natural element, and swimming not their habit. The act is accomplished in many ways, by different movements of the body or of the limbs, or by various combinations of such motions. Man swims with the arms and legs, or with the legs alone, in an attitude and with an action most like that of the frog. Ordinary quadrupeds can swim with movements of the legs much like walking. Some of these are specially fitted for swimming without decided modification of structure, as the otter, the beaver, the muskrat, though often in these cases he tail takes some part in propelling or guiding the animal; other mammals, as the pinnipeds, and especially the cetaceans and sirenians, swim more or less exactly like fishes, the propulsion being mainly from the movements of the tail and hinder part of the body, and the flippers or fins being mainly used for steadying the body or guiding the course. All such mammals swim under as well as on the water. Web-footed birds, and some whose feet are scarcely or not webbed, swim on or under water, chiefly by means of the feet; but many of them accomplish a kind of flight under water with the wings, and use the feet chiefly as rudders. Such is especially the case with penguins, whose wings are flipper-like; and with the dippers (*Cinclus*), which are thrush-like birds, and fly under water as they do in the air, without using their feet at all. Aquatic serpents swim with a wriggling or writhing motion of the whole body like that with which they crawl on land; in some of these, however, the tail is flattened to serve as a fin. (See *Hydrophidae*, and cuts under *sea-serpent*, *Hydrophis*, and *Platyrus*.) Aquatic anurous batrachians swim with their legs alone, when adult; their larvæ (tadpoles), and all tailed batrachians, swim like fishes, by movements of the hind part of the body and tail. Aquatic turtles swim with all four legs, and especially, in the cases of the marine forms, with their enlarged fore flippers. Nearly all crustaceans are aquatic, and swim with very variously modified limbs and tail, their natatorial organs being usually abdominal or postabdominal. (See *swimmeret*, *pleopod*, *rhinipodura*.) Many insects swim by the movement of specially modified legs which serve as oars, or in the cases of larvæ by undulatory movements of the whole body; some swim only on their backs, and others float, walk, or run on the surface of the water. A few mollusks, with-

out shells, swim with an undulation of the body or of processes of the mantle, but their usual modes of swimming are unlike those of animals with ordinary limbs or tail; some swim by energetic flapping of bivalved shells, others by ejecting a stream of water through siphons, or by setting a sort of sail which wafts them over the water. Aquatic worms swim by wriggling the whole body, and also by the action of multitudinous parapods or cilia. Jellyfishes and comb-jellies swim by rhythmical pulsations of a swimming-bell, or of the whole body, assisted or not by the action of some special organs. Animalcules swim mainly by ciliary action, but also by changes in the shapes of their bodies, and in some cases by special formations. See *swimming-bell*, *bladder*, *fin*, *foot*.

An ungulate non-ruminant quadruped, of the family *Suidæ* in a broad sense; any hog, pig, sow, or boar; in the plural, these animals collectively. The word is commonly used in the plural, *swine*, as a collective noun, meaning several individuals of a given species, as of the domestic hog, or several kinds of swinish animals, as the hog, the wart-hog, the peccary, the babirusa, etc. The most important breeds of swine are those originated in England during the present century. Some have been produced by crossing native hogs with China and Italian (Neapolitan) breeds. Among the most prominent are the following: the Berkshires, black pigs, with white on the feet, face, tip of the tail, and occasionally on the arm, and erect ears of medium size; the Essex, black pigs of small to medium size, with small ears at first erect, later drooping; and the Yorkshires, a well-established breed of large and small hogs of white color, resembling the Suffolk breed, also with white skin and small upright ears. Neapolitans represent a breed of rather small Italian swine, seldom bred in the United States. They are described as having a bluish-plum or slaty color, the skin nearly free from hair, and the ears small, standing forward horizontally. The English varieties, especially the Berkshires, are largely bred in the United States, where are also raised a number of native breeds. The Poland-China originated during the present century in Ohio from several breeds, including some so-called China hogs. They are characterized by a dark spotted or black color, small, broad, slightly concave face, and fine, drooping ears. The Duroc-Jersey, of unknown origin, has been bred in New Jersey for many years; they are large red animals with lopped ears. The Chester white originated in Chester county, Pennsylvania. Cheshires and Victorias are white swine, originating in New York State, which do not represent distinct breeds. The disease is caused by specific bacteria, and is localized in the lungs, giving rise to pneumonia and pleurisy. The digestive tract may be secondarily involved. In such cases diphtheritic inflammation of the mucous membrane of the large intestine is present. Swine-plague is not readily distinguished from *hog-cholera*. In the latter disease the lesions, chiefly limited to the large intestine, are in the form of round button-shaped ulcers and diphtheritic patches. Lung-disease is slight or absent. The specific bacteria causing *hog-cholera* are readily distinguished from those of *swine-plague*, and upon this distinction the diagnosis is mainly based. The introduction of diseased swine into a herd is probably the main cause of the spreading of both maladies.

2. A mechanical device for shifting a moving body, or a current of electricity, etc., from one course or track to another. Specifically—(a) In railroads, in its simplest form, two parallel lengths of rails joined together by rods, pivoted at one end, and free to move at the other end, forming a part of the track at its junction with a branch or siding. The switch-rails rest on metal plates laid on the sleepers, and, by means of a rod fastened to their free ends, can be moved sidewise. The ends of the next pair of rails and the ends of the first pair of the siding or branch are placed side by side, so that by the movement of the switch either pair may be brought in line with the track, and any car or engine passing the switch will be guided upon the rails to which the switch is directed. Such a switch may be used to connect several lines of rails. The objection to this form of switch is that a car moving on a track not connected with the switch is liable to be derailed by running off the open ends of the track. This has led to the adoption of safety-switches, of which there are various forms. One of the most common of these is the *split switch*, in which the ends of the rails, instead of being square, are drawn out (split) to a thin edge so as to lie close against the side of the next rail. The narrow rails used are flexible and are fitted with springs, so that in the event of a displacement of the switch the lateral pressure of the wheels will cause the points to move back and thus keep the wheels on the line, the points returning to their original position by the recoil of the springs. Another form of safety-switch is designed to keep unbroken the

'one who brings figs (hidden in the foliage) to light by shaking the tree,' hence 'one who makes rich men yield tribute by means of false accusations.' All these explanations are doubtful inventions. (d) The real explanation appears to lie in some obscene use of *σῶκος*, fig, this word, and the *L. ficus*, fig, with its Rom. forms, being found in various expressions of an obscene or abusive nature. This origin, whatever its particular nature, would explain the fact, otherwise scarcely explicable, that the original application of the term is without record.] **I. n. 1.** A tale-bearer or informer in general.

The poor man that hath naught to lose is not afraid of the sycophant or promotor.

*Holland*, tr. of *Plutarch's Morals*, p. 261. (*Trench*.)

This ordinance is in the first table of Solon's laws, and therefore we may not altogether discredit those which say they did forbid in the old time that men should carry figs out of the country of Attica, and that from thence it came that these pick-thanks, which bewray and accuse them that transported figs, were called sycophants.

*North*, tr. of *Plutarch*, p. 77.

The laws of Draco . . . punished it [theft] with death; . . . Solon afterwards changed the penalty to a pecuniary mulct. And so the Attic laws in general continued, except that once, in a time of dearth, it was made capital to break into a garden and steal figs; but this law, and the informers against the offence, grew so odious that from them all malicious informers were styled sycophants: a name which we have much perverted from its original meaning.

**syenite** (sī'e-nit), *n.* [*< L. syenites, sc. lapis, lit. 'stone of Syene,' < Syene, < Gr. Συήνη, a locality of upper Egypt.*] A rock composed of feldspar and hornblende, with or without quartz. The name *syenites* was given by Pliny to the red granitoid rock extensively quarried at Syene in Egypt. The term *syenite* was introduced into modern geological science by Werner, in 1788, but applied by him to a rock (from the Plauenscher Grund, near Dresden) not identical in composition with the *syenites* of Pliny, which latter is a hornblende granite, or granite in which mica is replaced by hornblende, whereas the rock which Werner called *syenite* is mainly made up of a mixture of feldspar and hornblende; hence there has long been more or less confusion in regard to the nomenclature of this rock. The English and some continental geologists have defined syenite as an aggregate of quartz, feldspar, and hornblende; while the Germans have generally regarded the quartz as not being an essential constituent of the rock: this latter view is that which has been adopted in the most recent English geological and lithological works. Syenite is a rock thoroughly crystalline in texture, and in general it much resembles granite in its mode of occurrence. The feldspathic ingredient is chiefly orthoclase, and this usually predominates considerably in quantity over the associated minerals; there is some trichite feldspar present, however, in most syenites and the same is true in regard to quartz, biotite, titanite, magnetite, apatite, zircon, and various other accessory minerals frequently found in small quantity in the granitic rocks. Sometimes the hornblende is replaced by augite; this variety is designated *augite-syenite*; that in which mica predominates is known as *micaceous syenite*. The range of syenite in geological age is similar to that of granite, and the frequent passage of one rock into the other shows how closely allied the two are, one result of which condition is that the nomenclature of the different syenites is correspondingly difficult. Typical syenites are by no means abundant, and in general the granitic rocks very considerably surpass the syenitic in economic importance. *Alcock, etc.*

**syllabical** (si-lab'i-kal), *a.* [*< syllabic + -al.*] Same as *syllabic*.

**syllabically** (si-lab'i-kal-i), *adv.* In a syllabic manner; by syllables.

In Amharic, for instance, which is printed syllabically, there are 33 consonantal sounds.

**syllabicate** (si-lab'i-kāt), *v. t.*; pret. and pp. *syllabicated*, ppr. *syllabicipating*. [*< syllabic + -ate*.] (Cf. Gr. συλλαβίζω, join letters to form syllables.) To form or divide into syllables.

**syllabification** (si-lab-i-kā'shon), *n.* [*< syllabic + -ation.*] The formation of syllables; especially, the division of a word into its constituent syllabic parts in writing and printing. The division of a word of more than one syllable into separate syllables is in great measure an artificial process, since a consonant intervening between two vowels is usually used under syllable to be reckoned as belonging to either one of them not less properly than to the other. This is especially true of the continuable consonants, the semivowels

and the fricatives (thus, *follow, arrow, ever, lesser, ashes, etc.*); a mute, particularly a surd mute (*p, t, k*), has more claim to go with the following vowel, because a mute is much more distinctly audible upon a following than after a preceding vowel (in *tea* than in *ate*). We tend also to reckon such a consonant to the vowel of whose force and pitch it seems most to partake; and, along vowel being regularly a diminuendo utterance, the strength of impulse falling off before it is ended, a following consonant seems naturally to belong to the vowel that succeeds (so *dai-ly, ei-ther, ea-sy, etc.*); on the other hand, a consonant of any kind after a short accented vowel so shares the latter's mode of utterance as to be naturally and properly combined with it; thus, *bi-ter (bitter), tak-l (tackle), hon-est, etc.* When two or more actually pronounced consonants come between vowels, it makes a difference whether they are or are not such as readily in our practice combine as initials before a vowel; thus, as we say *ply*, we divide *supply* into *eu-ply*, not *sup-ly*; but *subject* only into *sub-ject*. As for syllabification in printing (when a word has to be broken at the end of a line), that is a different and more difficult matter, partly because many silent consonants (especially in the case of doubled consonants) have to be dealt with; it also pays much regard to the history of a word, dividing which it is etymologically composed; and it has some arbitrary and indefensible usages, such as the invariable separation of *-ing*, by which we get such offenses against true pronunciation as *rag-ing, fac-ing*, instead of *rag-ing, fac-ing*; and even *miz-ture, junct-ure*, instead of *miz-ture, junct-ure*, owing to the notion that *-ure* rather than *-ture* is the ending.

**syllabification** (si-lab'i-f-i-kā'shon), *n.* [*< syllabify + -ation.*] Same as *syllabification*.

**syllabify** (si-lab'i-fi), *v. t.*; pret. and pp. *syllabified*, ppr. *syllabifying*. [*< L. syllaba, syllable (see syllable), + facere, make, do*; see *-fy*.] To syllabicate.

**syllabism** (sil'a-bizm), *n.* [*< L. syllaba, syllable, + -ism.*] Theory of or concerning syllables; also, syllabic character; representation of syllables.

In addition to these vestiges of a prior syllabism, a few ideographic characters are retained, as in the Proto-Medic syllabary, to designate certain frequently recurring words, such as king, country, son, name, and Persian.  
*Isaac Taylor, The Alphabet, I. 51.*

**syllabist** (sil'a-bist), *n.* [*< L. syllaba, syllable, + -ist.*] One who is versed in the dividing of words into syllables.

**syllabize** (sil'a-biz), *v. t.*; pret. and pp. *syllabized*, ppr. *syllabizing*. [*< L. syllaba, syllable, + -ize.*] To form or divide into syllables; syllabicate.

'Tis mankind alone  
Can language frame and syllabize the tone.  
*Howell, Verses prefixed to Parly of Beasts. (Davies.)*

In syllabizing, a totally artificial process, doubling is necessary, and very frequently the recoil is used, which it never is in speech.  
*Encyc. Brit., XXII. 384.*

**syllable** (sil'a-bl), *n.* [Formerly also *sillable, syllabe, syllab*; < ME. *sillable*, < OF. *syllable, silable* (with unorig. *-le*, as in *principle*, etc.), prop. *syllabe, sillabe*, < OF. *syllabe* = F. *syllabe* = Sp. *silaba* = Pg. *syllaba* = It. *silaba* = G. *silbe*, < L. *syllaba*, ML. also *silaba*, < Gr. συλλαβή, a syllable, several sounds or letters taken or joined together, lit. a taking together, < συλλαβάνειν, take together, put together, < σύν, with, together, + λαμβάνειν, λαβεῖν, take.] 1. The smallest separately articulated element in human utterance; a vowel, alone, or accompanied by one or more consonants, and separated by these or by a pause from a preceding or following vowel; one of the successive parts or joints into which articulated speech is divided, being either a whole word, composed of a single vowel (whether simple or compound) with accompanying consonants, or a part of a word containing such a vowel, separated from a preceding or following vowel either by a hiatus (that is, an instant of silence) or, much more usually, by an intervening consonant, or more than one. Syllables are the separate successive parts into which the ear apprehends the continuous utterances of speech as divided, their separateness consisting mainly in the alternation of opener and closer elements, or vowels and consonants. A normal syllable is a vowel utterance attended with subsidiary consonantal utterances. As to what sounds shall have vowel value in syllable-making, different languages differ; English allows, besides those usually called vowels, also *l* and *n*, as in *reken* (rek-n), *reckoned* (rek-n'd), *riddle* (rid-l), *riddles* (rid-lz). If the vowel is attended by both sonant and surd consonants, the sonant are in general nearer it, as in *print, firt*; and also, as in the same words, the opener sounds are nearer it than the closer. But the intricacy of construction of English syllables is tolerated by but few languages; and many (as the Polynesian) will bear nothing more than a single consonant to a vowel, and that one only before it. The assignment of a consonant or of consonants in syllabification to the preceding or the following vowel is in great part a matter of convention, depending on no real principle; thus, in *atley*, for example, the *l* is a division between the two vowels, like a wall between two fields, belonging to one no more than to the other. It is on syllabic division that the "articulate" character of human speech depends. (See *articulate*. Also compare *vowel and consonant*.) In prosody syllables are classed as *long, short, and common* (see these adjectives). See also *time*.

In this word [dáyly] the first *syllable* for his usual and sharpe accents sake to be always long, the second for his flat accents sake to be always short.

Its full title is: *A Syllabus*, containing the Principal Errors of our Times, which are noted in the Consistorial Allocations, in the Encyclicals, and in other Apostolical Letters of our Most Holy Lord, Pope Pius IX. . . . It is divided into ten sections. The first condemns pantheism, naturalism, and absolute rationalism; the second, moderate rationalism; the third, indifferentism and latitudinarianism; the fourth, socialism, communism, secret societies, Bible societies, and other "pests of this description"; the fifth, errors concerning the Church and her rights; the sixth, errors concerning civil society; the seventh, errors of natural and Christian ethics; the eighth, errors concerning Christian marriage; the ninth, errors concerning the temporal power of the pope; the tenth, errors of modern liberalism. Among the errors condemned are the principles of civil and religious liberty, and the separation of Church and State.

include other persons or things to which it does not apply properly or strictly. This figure includes *zeugma* and also the taking of words in two senses at once: the literal and the metaphorical as in the following passage, where the word *swifter* is used in both senses: "The judgments of the Lord are true and righteous altogether: there is no swifter also than honey, and the honeycombs" (Ps. LXIX. 9, 10). Also sometimes used as equivalent to *synchysis*.

If such want be in sundrie clauses, and of severall congruities or senses, and the supply be made to some than all it is by the figure *Syllapsis*, whom for that respect we call the [double supply].

Among these worms both sexes and sexless forms occur; and such heteronormism is associated with a mode of propagation by the spontaneous division of an asexual individual into two or more parts, which may severally become sexual persons. Many of the species are phosphorescent. See cut under *Autolytus*.

**syllidian** (si-lid'i-an), *n.* A worm of the family *Syllidæ*.

**syllogism** (sil'ô-jizm), *n.* [Formerly also *syllogisme*, *syllogisme*; < ME. *syllogisme*, *syllogisme*, < OF. *syllogisme*, *syllogisme*, F. *syllogisme* = Sp. *silogismo* = Pg. *syllogismo* = It. *silogismo*, *silogismo*, < L. *syllogismus*, < Gr. *σύνλογισμος*, a reckoning all together, a reasoning, a conclusion, < *σύνλογίζεσθαι*, bring together premises, infer, conclude, < *σύν*, together, + *λογίζεσθαι*, reason, < *λόγος*, word, something spoken: see *Logos*.] 1. A logical formula consisting of two premises and a conclusion alleged to follow from them, in which a term contained in both premises disappears: but the truth of neither the premises nor the conclusion is necessarily asserted. This definition includes the *modus ponens* (which see, under *modus*), the formula of which is that from the following from an antecedent of a consequent, together with the antecedent, follows the consequent. This depends upon two principles—first, the principle of identity, that anything follows from itself; and, secondly, the principle that to say that from A it follows that from B follows C is the same as to say that from A and B follows C. Under the former principle comes the formula that the following from an antecedent of a consequent follows from itself, and this, according to the second principle, is identical with the principle of the *modus ponens*. But the syllogism is often restricted to those formula which embody the *nota nota* (or *maxim*, *nota nota est nota rei ipsius*), which may be stated under the form—from the following of anything from a consequent follows the following of the same thing from the antecedent of that consequent. Under this form it is the principle of contraposition. The simplest possible of such syllogisms is like this: Enoch was a man; hence, since being mortal is a consequence of being a man, Enoch was mortal. All syllogisms except the *modus ponens* involve this principle. A syllogism which involves only this principle, and that in the simplest and directest manner, like the last example, is called a *syllogism in Barbara*. In such a syllogism the premise enunciating a general rule is called the *major premise*, while that which subsumes a case under that rule is called the *minor premise*. A syllogism whose cogency depends only upon what is within the domain of consciousness is called an *epithymic*, or *emphatic*, syllogism. A syllogism which supposes, though only probably, that a generalizing character in nature is called an *epithymic*, or *epithymic*, syllogism. (See *epithymic inference* (under *inference*), and *induction*, 5.) Analytic syllogisms are either necessary or probable. Necessary syllogisms are either non-relative or relative. Non-relative syllogisms are either categorical or hypothetical, but that is a trifling distinction. They are also either direct or indirect. A direct syllogism is one which applies the principle of contraposition in a direct and unqualified manner. An indirect syllogism is either

minor or major. A minor indirect syllogism is one in which from the major premise of a direct or less direct syllogism and a consequence which would follow from its conclusion infers that the same consequence would follow from the minor premise. The following is an example: All men are mortal, but if Enoch were a man, he would be mortal; hence, if Enoch were a man, he would be mortal; the *table error*. A major indirect syllogism is one in which from the minor premise of another syllogism and a consequence from the conclusion infers that the same thing would follow from the major premise. Example: All patriarchs are men, but if all patriarchs are dead, they are dead; hence, if all men die, the *table error*. Such examples may be much complicated: thus, No one translated is mortal; but if no mortals go to heaven, I am much mistaken; hence, if all who go to heaven are translated, I am much mistaken. To say that from a proposition it would follow that I err when I know I am right would amount to denying that proposition, and, conversely, to deny it positively would amount to saying that, if it were true, I should be wrong when I know I am right. A denial is thus the precise logical equivalent of that consequence. An indirect syllogism in which the contraposition involves such a consequence is said to be of the second or third figure, according as its indirection is of the minor or major kind. The fourth figure, admitted by some logicians, depends upon contraposition of the same sort, but more complicated, like the last example. The first figure comprises, in some sects of logic, the direct syllogism only; in others, the direct syllogisms together with those which are otherwise assigned to the fourth figure. (See figure, 9.) The names of the different varieties, called *moods* of *syllogism*, are given by Petrus Hispanus in these hexameters:

Barbara: Celarent: Darii: Ferio: Bandipon:  
Celantes: Dabitis: Papesmo: Friscomorum:  
Cesaro: Camestres: Festino: Baroco: Darapti:  
Felapton: Disamis: Datisi: Bocardo: Ferison.

(See these words, and mood, 2.) Probable deductive syllogisms are really direct statistical inferences (which see, under *inference*). The following is an example: In the African race there are more female than male births; the colored children under one year of age in the United States at the time of the census of 1880 form a random sample of births of Africans; hence, there should be more females than males under one year of age among the colored population of the United States in 1880. The conditions of the validity of such a syllogism are two: first, the character forming the major term (here that of the relative numbers of females and males) must be taken at random—that is, it must not be one which is likely to be subject to peculiar uniformities which could affect the conclusion; second, the minor term, or sample taken, must be numerous and a random sample—that is, not likely to be of a markedly different character from that which is general in the class sampled. The conclusion is probable and approximate—that is, the larger the sample is the smaller will be the probable error of the predicted ratio. Synthetical or ampliative syllogisms are indirect probable syllogisms. The major indirect probable syllogism is induction (which see). The following is an example: The colored children under one year of age in the United States in 1880 form a random sample of births of Africans; but if there ought to have been more males than females among those children, the colored population of the United States is very different from the bulk of Africans; hence, if in the African race in general there are more male than female births, the colored population of the United States is very different from the bulk of Africans. It must be remembered that an observation of a ratio is never exact, but merely admits some values and excludes others; its denial excludes the former, and admits the latter. The denial of a statistical rule is thus itself a statistical rule; and hence such forms as the following are indirect probable syllogisms: American colored children under one year of age in 1880 form a sample of African births; among these the females are in excess; hence, in African births generally the females are probably in excess. The minor indirect probable syllogism is hypothetical inference. (See *hypothesis*, 4.) Relative syllogisms are those which involve other than merely transitive relations. These were first studied by De Morgan, and afterward by an American logician, but were involved in much difficulty until another American student, O. H. Mitchell, furnished in 1882 the clue to their unravelment. Every relative syllogism has at its core a non-relative syllogism, but this is generalized in a peculiar way—namely, every relative term refers to two or more universes, which may be coextensive, or may be entirely unlike as universes of material things, of space, of time, of qualities, etc. A relative proposition refers to some or all of each of several universes, and the order of the reference is material. (See *proposition*, 3.) Transpositions, identifications, and diversifications are performed upon principles now clearly made out. An important circumstance in regard to relative syllogism is that the same premise may be repeatedly introduced with new effect. Among relative syllogisms are comprised all the elements of mathematical reasoning, especially the Fermatian inference, the syllogism of transposed quantity, and the peculiar reasoning of the differential calculus.

Many times, when she wol make

**Sylph** (silf), *n.* [= *D. sylphe*, *silfe* = *G. sylphe* = *Dan. sylfe* = *Sw. sylfe*, < *F. sylphe* = *Sp. silfo* = *Pg. sylpho*, < *NL. sylpha*, a factitious name, found in Paracelsus, appar. < *Gr. σίλφω*, a kind of beetle. Other names of elemental spirits (*nymph, gnome, salamander*) are taken from the Gr., only one (*nymph*) having such use in Gr., the others being, like *sylph*, arbitrary. The spelling *sylph* (*NL. sylpha*), with *y* instead of *i*, seems to have been used to make it look more like *nymph*, and because to occultists and quacks like Paracelsus words spelled with *y* look more Greek and convincing. As *salamander*, orig. 'a kind of lizard supposed to live in fire,' was made, by an easy transfer, to mean 'a

spirit of fire,' and *gnome*, quite arbitrarily (see *gnome*), was made to mean 'a spirit of earth,' so *sylph*, orig. (in the *Gr. σίλφω*) 'a beetle or insect,' seems to have been taken as 'a light flying creature,' hence 'a spirit of the air.' According to Litré the name was based on an Old Celtic word meaning 'genius,' given in the Latinized plural forms *sylfi, sylfi, sylphi, m., sulevæ, suleviæ, f.* 1. An imaginary being inhabiting the air; an elemental spirit of the air, according to the system of Paracelsus, holding an intermediate place between material and immaterial beings. Sylphs are male and female, have many human characteristics, and are mortal, but have no soul. The term in ordinary language is used as feminine, and often applied figuratively to a young woman or girl of graceful and slender proportions.

**Sylvia** (sil'vi-ä), *n.* [*NL.* (Scopoli, 1769), also *Silvia* (Cuvier, 1800), < *L. silva, sylva*, a wood, a forest.] 1. In *ornith.*: (a) A genus of small dendrostrous or turdoid oscine passerine birds, typical of the family *Sylviidae*; the warblers proper. This genus was originally constituted for a part of the Linnean genus *Motacilla*, and has been loosely used for several hundred small warbler-like birds of both hemispheres, now dissociated in different families. The name is commonly attributed to Latham (1790), but was first used by Scopoli in 1769. The type is now assumed to be the common whitethroat, *Motacilla sylvia* of Linnaeus, *Sylvia cinerea* of Bechstein, also called *S. rufa*; and the term is restricted to a few very closely related species of chiefly Palearctic warblers, of small size, with scutellate tarsi, bristled gape, twelve tail-feathers, axillaries never yellow, first primary spurious, and the bill strictly sylvine. Some of the leading species in this narrow sense are *S. nisoria*, the barred warbler; *S. hortensis*, the petti-chaps or garden-warbler (see cut under *petti-chaps*); *S. curruca*, the lesser whitethroat; *S. atricapilla*, the blackcap; *S. orpheus*, the orphean warbler. These, like *S. cinerea*, are all found in Great Britain. No bird of this genus occurs in America, though most of the American warblers which were known to the older ornithologists were placed in *Sylvia*. In *ornith.*: (a) A genus of American warblers, proposed by Swainson in 1827, for many years in use, and giving name to the family *Sylviocolidae*. It was based upon the blue yellow-backed warbler, *S. americana*, subsequently made the type of the genera *Chloris* (Boie, 1826), *Parula* (Bonaparte, 1838), and *Compsothlypis* (Cabanis, 1850), and generally applied to the species of *Dendroica* and some related genera before the recognition of the fact that the name was preoccupied. It fell into disuse about 1842, and the name of the family has since been changed to *Mniotiltidae* or *Dendroceidae*. See these family names. The limits of the family, like those of its representative genus, have fluctuated widely, and no exclusive diagnosis is practicable. As compared with *Turdidæ*, the *Sylviidæ* differ in the usually unspotted plumage of the young birds, which differ little from the adults. Compared with *Muscicapidæ*, the *Sylviidæ* lack the breadth and flatness of the bill which characterize the true flycatchers, and the great development of the rictal bristles. The family is very widely distributed in the eastern hemisphere, but is scarcely represented in America, where the birds formerly classed as *Sylviidæ* are, with very few exceptions, *Mniotiltidæ*, having but nine primaries and being otherwise quite different. The *Sylviidæ* include many modern genera, and are variously subdivided. In one classification they are made to consist of 7 subfamilies — *Drymaceine*, *Calamherpine*, *Phylloscopine*, *Sylviine*, *Ruticilline*, *Sarothamnine*, and *Acronotinae*. This theological revolution or pseudo-reformation has done, and is still doing, an incalculable amount of harm; but it was a revolt of reason against the tyranny of *symbololatry*, and proved a wholesome purgatory of orthodoxy. Schaff, *Christ and Christianity*, p. 167.

Composed of two parts whose geometrical relations to one another are those of a body and its image in a plane mirror, every element of form having a corresponding element upon the opposite side of a median or symmetrical plane, upon one

continued perpendicular to that plane and at the same distance from it: said also of each part relatively to the corresponding part: as, the right arm is *symmetrical* with the left.—3. In a weakened sense, in *zool.*, having similar parts in reversed repetition on the two sides of a median plane, or meson, through an axis of the body, generally the longitudinal. Not all the parts need so correspond, nor need those which do correspond be equal.—4. Composed of parts or determined by elements similarly related to one another, and either having no determinate order (as the three lines which by their junction form a summit of a cube) or else in regular cyclical order: said also of the parts in their mutual relation.—5. Specifically, in *bot.*, of flowers, numerically regular; having the number of members the same in all the cycles or series of organs—that is, of sepals, petals, stamens, and carpels: same as *isomerous*, except that in a symmetrical flower there may be more than one set of the same kind of organs. **symmetrophobia** (sim'e-trō-fō'bi-ä), *n.* [Irreg. < *Gr. συμμετρία, symmetry*, + *φόβος, fear*.] An imagined dread or supposed intentional avoidance of architectural or structural symmetry, or its result, as exhibited in the unsymmetrical structure of Egyptian temples, and very widely in Japanese art. [A fanciful term.]

A *symmetriphobia* that it is difficult to understand. J. Ferguson, *Hist. Arch.*, i. 115.

There were many bends in it (the avenue at Karnak), but the fact affords no fresh proof of Egyptian *symmetriphobia*. Miss A. B. Edwards, tr. of Maspero's Egypt. Archaeol. (1887), p. 86.

**symmetry** (sim'e-trī), *n.* [Formerly also *symmetrie, simmetrie*; < *OF. symmetrie, F. symétrie* = *Sp. simetría* = *Pg. simetría* = *It. simetría, simmetria* = *D. simmetrie* = *G. symmetrie* = *Sw. Dan. symmetri*, < *L. symmetria*, < *Gr. συμμετρία*, agreement in dimensions, arrangement, etc., due proportion, < *συμμετρος*, having a common measure, commensurate, even, proportionate, moderate, in due proportion, symmetric, < *σύν, with*, + *μετρον, measure*.] 1. Proportionality; commensurability; the due proportion of parts; especially, the proper commensurability of the parts of the human body, according to a canon; hence, congruity; beauty of form. The Greek word *συμμετρία* was probably first applied to the commensurability of numbers, thence to that of the parts of a statue, and soon to elegance of form in general.

2. The metrical correspondence of parts with reference to a median plane, each element of geometrical form having its counterpart upon the opposite side of that plane, in the same continued perpendicular to the plane, and at the same distance from it, so that the two halves are geometrically related as a body and its im-

age in a plane mirror: so, usually, in geometry. Especially, in *arch.*, the exact or geometrical repetition of one half of any structure or composition by the other half, only with the parts arranged in reverse order, as notably in much Renaissance and modern architecture—for instance, in the placing of two spires, exact duplicates of each other, on the front of a church. Such practice is very seldom followed in the best architecture, which in general seeks in its designs to exhibit harmony (see *harmony*, 3), but avoids symmetry in this sense.

We have an Idea of *Symmetry*; and an axiom involved in this Idea is that in a symmetrical natural body, if there be a tendency to modify any member in any manner, there is a tendency to modify all the corresponding members in the same manner.

Whoell, Philos. of Inductive Sciences, I. p. xxx.

John and Jeremiah sat in *symmetry* on opposite sides of the fireplace; the very smiles on their honest faces seemed drawn to a line of exactitude.

Mrs. Gaskell, Sylvia's Lovers, xiv.

3. The composition of like and equably distributed parts to form a unitary whole; a balance between different parts, otherwise than in reference to a medial plane: but the mere repetition of parts, as in a pattern, is not properly called *symmetry*.—4. Consistency; congruity; keeping; proper subordination of a part to the whole.

It is in exact *symmetry* with Western usage that this great compilation was not received as a code until the year 1369. Stubbs, Medieval and Modern Hist., p. 167.

5. In *biol.*: (a) In botany, specifically, agreement in number of parts among the cycles of organs which compose a flower. See *symmetrical*, 3. (b) In zoölogy and anatomy, the symmetrical disposition or reversed repetition of parts around an axis or on opposite sides of any plane of the body. *Symmetry* in this sense is something more and other than that due proportion of parts noted in def. 1, since it implies a geometrical representation approximately as in def. 2 (see *proportionality*); it is also to be distinguished from mere metamorphism, or the serial repetition of like parts conceived to face one way and not in opposite directions; it coincides in some cases with *actinomerism*, and in others with *metamerism* or *platymerism* (see *actinomerism*, *platymerism*). Several sorts of symmetry are recognized. One is *radial* or *actinometric*, in which like parts are arranged about an axis, from which they radiate like the parts of a flower, as in many zoöphytes and echinoderms; but such symmetry is unusual in the animal kingdom, being mainly confined to some of the lower classes of invertebrates, and even in these the departures from it are frequently obvious. (See *bivium*, *trivium*, and cuts under *echinopodium* and *Spatangoides*.) The tendency of animal form on the whole being to grow along one main axis (the longitudinal), with symmetrical duplication of parts on each side of the vertical plane (the meson) passing through that axis, it follows that the usual symmetry is *bilateral* (see below). This is exhibited only obscurely, however, by some cylindrical organisms, as worms, whose right and left "sides," though existent, are not well marked; and to such symmetry of ringed or annulose forms the term *zonal* is sometimes applied. When the ordinary metamorphic divisions of any animal, as a vertebrate or an arthropod, are conceived as not simply serial, but also as antipodal, such disposition of parts is regarded as constituting *anteroposterior symmetry*, in which parts are supposed to be reversed repetitions of each other on opposite sides of an imaginary plane dividing the body transversely to its axis, in the same sense that right and left parts are reversed repetitions of each other in bilateral symmetry. The existence of the last is denied or ignored by those who consider the segments of an articulate or vertebrate body as simply serially homologous; but in the view of those who recognize it the back of the arm corresponds to the front of the thigh, the convexity of the elbow (backward) to the convexity of the knee (forward), the extensor brachii to the extensor cruris, etc. Anteroposterior symmetry is also recognized by some naturalists in certain arthropods from the arrangements of the legs (in amphipods, for example), the correspondences observed between anal and oral parts, etc. Since any body is a solid, and therefore may be intersected by three mutually perpendicular planes, two of which are concerned in bilateral and anteroposterior symmetry respectively, a kind of symmetry called *dorsobdominal symmetry* is recognized by some, being that of parts lying upon opposite sides of a longitudinal horizontal plane passing through the axis of the body, as that between the neural and hemal arches of a vertebra; but it is generally obscure, and probably never perfect. *Bilateral symmetry* (see *eupileural*) is the nearly universal rule in vertebrates and articulate. The chief departures from it in vertebrates are in the family of flatfishes or flounders (as the plaice, turbot, halibut), in parts of the cranium of various cetaceans and the single great tusk of the narwhal. In the skulls (especially the ear-parts) of sundry owls, in the beak of a plover (*Anarhynchus*) which is bent sideways, in the atrophy of one of the ovaries and oviducts in most birds, and in the position finally assumed by the heart and great vessels and most of the digestive organs of vertebrates at large. (See cuts under *asymmetry*, *narwhal*, *plaice*, and *plover*.) In articulate noticeable exceptions to it are seen in the difference between the great claws or chela of a lobster, etc. In *Mollusca* asymmetry is the rule rather than the exception. (See *Anisopleura*, *Limpurea*.) A certain symmetry, apart from that exhibited by an animal body as a whole, may be also predicated of the several components of any part in their respective selves; as, the *symmetry* of a carpus or of a tarsus whose several bones are regularly disposed on each side of its axial plane, or around a central bone. (See cuts under *carpus* and *tarsus*.)

—*Axis of symmetry*. See *axis*.—*Center of symmetry*. See *center*.—*Kinetical symmetry*, the equality of the principal axes of a body, through its center of mass.

—*Plane of symmetry*, a symmetrical or median plane.—*Quartic symmetry*. See *quartic*.—*Quintic symmetry*,

regularity of form depending on a pentagon being regular. See *quintic*.—*Radial symmetry*. See *radial*.—*Rectangular or right symmetry*, symmetry depending on that of the right angle, or consisting in some angle being a right angle.

—*Skew symmetry*. See *skew*.—*Uniform symmetry*, in *arch.*, such disposition of parts that the same ordinance recurs throughout the whole. Syn. *Symmetry*.—*Proportion*. *Proportion* is the more general word, being applicable to numbers, etc.; it is also the more exact. *Symmetry* is limited to the relation of the parts of bodies, especially living bodies; as, *symmetry* in the legs of a horse, it is thus sometimes more external. *Symmetry* sometimes is more expressive of the pleasure of the beholder. *Symmetry* is the opposition of equal quantities to each other. *Proportion* the connection of unequal quantities with each other. The property of a tree in sending out equal boughs on opposite sides is *symmetrical*. Its sending out shorter and smaller toward the top, *proportional*. In the human face its balance of opposite sides is *symmetry*, its division upward, *proportion*. (Ruskin.)

**sympalmograph** (sim-pal'mo-graf), *n.* [*< Gr. palin, together, + grapho, vibration (& palin, vibration, + grapho, to write.)*] A kind of apparatus used to exhibit Lissajous curves (see under *curves*) formed by the combination of two simple harmonic motions. A convenient form employs a double pendulum, the rate of oscillation of whose parts can be varied at will, while a suitable style traces out upon a lampblack surface the curves resulting from the combined motions.

**sympathetic** (sim-pa-thet'ik), *a.* and *n.* [*Cf. sympathetia* (in technical use); *< LGr. sympathēos*, having sympathy, *< Gr. an-sym-ia, sympathy*; see *sympathy*.] **I. a.** 1. Pertaining to, expressive of, proceeding from, or exhibiting sympathy, in any sense; attended with sympathy.

H. James, Jr., Trans. Sketches, p. 291.

4. In *anat.* and *zool.*, effecting a sympathy or consentaneous affection of the viscera and blood-vessels; uniting viscera and blood-vessels in a nervous action common to them all; inhibitory of or controlling the vital activities of viscera and blood-vessels, which are thereby subjected to a common nervous influence; specifically, of or pertaining to a special set of nerves or nervous system called the *sympathetic*. See below.—5. In *acoustics*, noting sounds induced not by a direct vibration-producing force, but by vibrations conveyed through the air or other medium from a body already in vibration. The phenomena of resonance are properly examples of sympathetic sound.—*Sympathetic headache*, pains in the head as the result of comparatively distant irritations.—*Sympathetic ink*. See *ink*.—*Sympathetic nerve*, the nerve of the sympathetic system; in particular, one of the two main sympathetic cords extending the whole length of the vertebral column. These ganglia, in man, correspond in number to the vertebrae against which they lie, except in the neck, where there are three pairs, and on the coccyx, where there is but a single one; the ganglion innervates, communicating branches *rami communicantes*, *rami rariscentes*, to and from the spinal and some of the cranial nerves, unite the sympathetic system with the cerebrospinal axis. The branches of distribution of the sympathetic system supply chiefly the trunk-viscera and the walls of the blood-vessels and lymphatics. The sympathetic nerves differ from the cerebrospinal nerves in having generally a grayish or reddish color, and in the greater number and more widely distributed ganglia connected with them. The sympathetic nerve is also called *great sympathetic*, *tri-auricularis*, *gastrocnemius*.—*Sympathetic nervous system*. (a) In vertebrates, a set of nerves consisting essentially of a longitudinal series of ganglia on each side of the spinal axis, connected by commissures or commissural nerve-fibers, forming a double chain from head to tail, and giving off numerous branches which form special plexuses

in the principal cavities of the body, and other plexuses surrounding and accompanying the viscera, blood-vessels, disjunct from but intimately connected by anastomoses with the nerves of the corresponding organs. (b) In man the sympathetic system consists (1) of the two main sympathetic chains above described, (2) of the plexuses of cranial ganglia, (3) of three great ganglionic plexuses of sympathetic plexuses, in the thoracic, abdominal, and pelvic regions respectively, (4) of smaller ganglia connected with the abdominal and other viscera, (5) of communicating nerves or commissures, where these ganglia or plexuses are connected with one another and with nerves of the cerebrospinal system; (6) of distributive nerves supplying the viscera and vessels, whereby the sympathetic reaches all parts of the body. See *anatomy* and *physiology*. (b) In invertebrates, as *Vermetus*, a posterior part of the visceral nervous system, passing on to the enteric tube, and corresponding to a true enteric nervous system; so called in view of its physiological relations, without reference to the actual homology implied with the sympathetic system of a vertebrate.—*Sympathetic numbers*, numbers absurdly supposed to have a tendency to come together by chance.—*Sympathetic ophthalmia*, inflammation of one eye due to lesion in the opposite eye.—*Sympathetic powder*. See *powder*.—*Sympathetic resonance*, the communication of vibration from one sounding body to another in its proximity. Thus, if two musical strings are stretched over the same sounding-board and one of them is struck, the other will vibrate also if tuned to the same note, or, further, if tuned to give the octave or the fifth.—*Sympathetic sounds*, sounds produced by means of vibrations caused by the vibrations of some sounding body, these vibrations being communicated by means of the air or some intervening liquid or solid body.—*Sympathetic string*, in various classes of stringed musical instruments, a string that is intended to be sounded by sympathetic vibration, and not by direct excitation.

**II. n.** 1. The sympathetic nervous system, or the sympathetic nerve.—2. One who is peculiarly susceptible, as to hypnotic or mesmeric influences; a sensitive.

Favorable conditions may make any one hypnotic to some extent, in a degree sufficient, perhaps, to dull the physical vision and excite the mental vision. Naturally enough a company of *sympathetics* may be similarly influenced.

(b) To feel in consequence of what another feels; be affected by feelings similar to those of another, commonly in consequence of knowing the other to be thus affected.

(b) The influence which the physiological or pathological state of one individual has in producing the same or an analogous state in another at the same time or in rapid succession, as exemplified in the hysterical convulsions which affect a number of women on seeing one of their companions suffering from hysteria, or the yawning produced by seeing an-

There are about 165 species, natives of warmer parts of Asia, Australia, and America, but not known in Africa. They are trees or shrubs, of smooth, and turning yellowish in drying. They bear ternate toothed or entire leaves, and axillary racemes of spikes, sometimes reduced to a single flower. The fruit is an oblong or roundish berry or drupe. Thus in a dichotomous branching only one of the secondary axes may develop strongly, the weaker branch appearing as a small lateral shoot from its base; and an apparent primary shoot is thus produced which in reality consists of the bases of single branches of consecutive forkings. Such an axis is termed a *pseudaxis* or *sympodium*. *Encyc. Brit.*, IV. 93.

The term *synagogue* (like our word *church*) signifies first the congregation, then also the building where the congregation meet for public worship.

2. The building where such instruction and worship are maintained. The synagogue first came into prominence in the religious life of the Jewish people during the exile, and, since the destruction of the temple and the dispersion of the Jews, constitutes their customary place of worship. The organization of the synagogue consists of a board of elders presided over by a ruler of the synagogue (Luke viii. 41, 49, xlii. 14). The worship is conducted according to a prescribed ritual, in which the reading of the Scripture constitutes a prominent part. Formerly the officers of the synagogue exercised certain judicial functions, and the synagogue itself was the place of trial (Luke xii. 11, xvi. 12), but this is no longer the case.

**synalephe, synalephe** (sin-a-lē'fē), *n.* [= *F. synalephe*, *< L. synalephe*, *< Gr. συναλεφή*, the contraction of two syllables into one, *< συναλειφειν*, smear together, smooth over, unite, *< συν*, together, + *αλειφειν*, anoint.] The blending of two successive vowels so as to unite them in one syllable, as by syneresis, synizesis, crasis, so-called elision, or a combination of these; especially, the obscuration or suppression of a final vowel-sound (vowel or diphthong) before an initial vowel-sound, as in *th' enemy* for *the enemy*. Usually, as in the instance just given, the final vowel is only obscured, not suppressed, being audible. When the final vowel is entirely suppressed, as in French *l'amant* for *le amant*, there is no longer a true blending or synalephe, but the term has been extended to include such cases. What is commonly called *elision* is usually synalephe or blending, not ecthipsis or suppression.

I have named the *synalepha*, which is the cutting off one vowel immediately before another.

The tail is fitted for climbing and scrambling about in trees and bushes, as in the creepers, and the feet are strongly prehensile, with large curved claws. They are small birds (a few inches long), but build huge coarse nests, sometimes 2 or 3 feet in diameter, or as large as a barrel, of sticks and twigs loosely thrown together, in the recesses of which the eggs are laid upon a nest proper of soft substances. There is great uniformity in the eggs, which are of a white or pale-bluish color. The subfamily is also called *Anabatinae*.

These animals resemble worms, and are of such delicacy of structure as to be almost transparent. The long thin cylindrical body is constricted here and there, and the head is surrounded with a fringe of tentacles. The calcareous concretions of the integument which form a hard shell or test in most echinoderms are here reduced to certain flat perforated plates here and there, to which anchorate hooks or anchor-shaped spicules are attached, forming very characteristic structures. (See *cutis ancorea*, *Holothuridea*, and *Synaptidae*.) There are several species. *S. digitata* is British. *S. girardi* is common on the Atlantic coast of the United States, living in the sand at about low-water mark. They are very fragile, and readily break to pieces if disturbed or put where they are uncomfortable.

They are fragile marine organisms, vermiform, and so transparent or with such thin and colorless skin that the internal organs may be seen through it.

Baird, 1857), < Gr. *synaptōs*, joined together, + *μῦς*, a mouse.] A remarkable genus of *Arvicolinae*, connecting the lemmings with ordinary voles or field-mice (whence the name). The upper incisors are grooved, a feature unique in the subfamily; the teeth in other respects, and the skull, are as in the true lemmings of the genus *Myodes*, while the external characters are those of *Arvicola* proper. There is only

See *syncretist*. This word first passed into common use at the Reformation, and was then used indifferently, in both a good and a bad sense, to designate the attempted union of different sects on the basis of tenets common to all. It soon lost all but its contemptuous meaning, and became specifically restricted to the system of a school of thinkers within the Lutheran Church.

He is plotting a carnal *syncretism*, and attempting the reconciliation of Christ and Belial. *Baxter*. (*Imp. Diet.*)

The word has somewhat varied application to certain embryonic formations and to some adult tissues, as striped muscular fiber, certain parts of sponges, etc.

The ectoderm [of a calcareous sponge] is a transparent, slightly granular, gelatinous mass in which the nuclei are scattered, but which, in the unaltered state, shows no trace of the primitive distinctness of the cells which contain these nuclei, and is therefore termed by Haeckel a *syncytium*. *Huxley*, Anat. It includes Neotropical arboreal prehensile-tailed porcupines, closely related to *Sphenomurina*, but differing in the broad and highly arched frontal region, and the greater development of spines. **syngensis** (sin-je-nē'sis), *n.* [NL., < Gr. *syn*, together, + *gēneis*, generation.] Reproduction in which a male and a female take part, one furnishing spermatozoa and the other an ovum, so that the substance of the embryo is actually derived from both parents. This is the rule, perhaps without exception, in sexual generation, and opposes the view of the permists, that the embryo comes from the male element, for the development of which the female furnishes only the nidus, and that of the ovulists, that the embryo is derived entirely from the female, the male principle affording only the requisite stimulus to development. As a doctrine or theory, one form of syngensis supposes every germ to contain the germs of all generations to come, and is opposed to *epigenesis*.

The theory of *syngensis*, which considers the embryo to be the product of both male and female, is as old as Empedocles.

The fruit is a mucilaginous syncarp, composed of coalescent berries with black obovoid seeds without albumen, and mainly composed of the large embryo. There are about 10 species, natives of tropical America, from the West Indies and Mexico to Brazil. They are irregular climbers, rooting at the nodes, and there bearing long-stalked leaves, the earlier arrow-shaped, the later three- to nine-divided. **synocreate** (sin'ō-kre-ät), *a.* [*< Gr. syn*, together, + *E. ocreate*.] In bot., uniting together on the opposite side of the stem from the leaf, and inclosing the stem in a sheath: noting stipules so characterized. Compare *ocreate*, 2.

**synod** (sin'od), *n.* [Early mod. E. also *synode*, *sinode*; < F. *synode* = Sp. *sinodo* = Pg. *synodo* = It. *sinodo*, < L. *synodus*, < Gr. *synodos*, a coming together, an assembly, meeting, synod, < *syn*, together, + *odos*, way, road. Cf. *exode*, *exodus*.] 1. An assembly of ecclesiastics or other church delegates duly convoked, pursuant to the law of the church, for the discussion and decision of ecclesiastical affairs; an ecclesiastical council. Synods or councils are of five kinds — ecumenical, general, national, provincial, and diocesan. For definition of their several characteristics, see *council*, 7.

Why should you have a *Synod*, when you have a Convocation already, which is a *Synod*?

Selden, Table-Talk, p. 108.

Twice a year, in accordance with the canonical institutions of Christian antiquity, had it been ordered of old in an English Council that every bishop and his priests should meet together in *synod*; the common form of proceeding which was used in these early clerical gemotes is believed to be still extant. R. W. Dixon, Hist. Church of Eng., xix.

They [the bishops] had large estates which they held of the king, seats in the national council, preeminence in the national *synod*, and places in the general councils of the church. Stubbs, Const. Hist., § 378.

Specifically — 2. In Presbyterian churches, the court which ranks above the presbytery, and either is subordinate to a general assembly (as in most of the larger denominations) or is itself the supreme court of the church. In the former case the presbyteries of the whole church are grouped into synods, each of which comprises all the parishes or congregations of a particular district. The members of the synod are in most cases the members of all the presbyteries within its bounds; but in some churches the court is composed of delegates from the presbyteries.

3. A meeting, convention, or council.

Had a parliament  
Of fiends and furies in a *synod* sat,  
And devis'd, plotted, parlied, and contriv'd,  
They scarce could second this.  
Heywood, Fair Maid of the West (Works, ed. 1874, II. 350).

Well have ye judged, well ended long debate,  
*Synod* of gods!  
Milton, P. L., ii. 391.

4. In *astron.*, a conjunction of two or more planets or stars.

Her office they prescribed; to the other five  
Their planetary motions and aspects,

Of noxious efficacy, and when to join  
In *synod* unbeneign.  
Milton, P. L., x. 661.

**Holy Governing Synod** (of all the Russias), a synod which is the highest ecclesiastical authority in the Russian Church. It consists of several metropolitans and other prelates and officials — the chief procurator of the synod representing the czar. It was instituted by Peter the Great in 1721, to supply the place of the patriarch of Moscow. The last patriarch had died about 1700, and Peter would not allow the appointment of a successor,

**synonymics** (sin-ō-nim'iks), *n.* [*Pl. of synonymic (see -ics).*] Same as *synonymy*.

**synonymist** (si-non'i-mist), *n.* [*< synonym + -ist.*] One who collects and explains synonyms; specifically, in *nat. hist.*, one who collects the different names or synonyms of animals or plants.

**synonymity** (sin-ō-nim'i-ti), *n.* [*< synonym + -ity.*] The state of being synonymous; synonymy.

To found any harmonic theories on the *synonymity* of tones in any temperament, when there is known to be no *synonymity* in nature, and when the artificial *synonymity* thus engendered varies from temperament to temperament, is only comparable to deducing geometrical conclusions from the mere practical construction of figures.

*Ellis*, in *Helmholtz's Sensations of Tone*, App., p. 660.

**synonymize** (si-non'i-miz), *v. t.*; pret. and pp. *synonymized*, ppr. *synonymizing*. [*< synonym + -ize.*] To express by words of the same meaning; express the meaning of by an equivalent in the same or another language. Also spelled *synonymise*.

*Selden*, *Illustrations of Drayton's Polyolbion*, ii.

4. A system of synonyms; a collection of synonyms; also, the study of synonyms; the use of synonyms in expressing different shades of meaning; the discrimination of synonyms; especially, in *nat. hist.*, the sifting of synonyms to determine the onyms. In botany and zoology the synonymy of a species of plant or animal, in the concrete, is a list of the several different names which have been applied to it by its various describers or classifiers, implying on the synonymist's part the discrimination not only of the synonyms of the species, but of the homonyms of related species, for the especial purpose of determining the onym of each species. Thus, *Falco fuscus* and *Falco obscurus* may be synonyms of one and the same species of falcon, yet *Falco fuscus* may be a homonym of two different species of falcon, and it may be that neither name is the onym of either of these species. Synonymy in natural history has become of late years so extensive and so intricate that probably no naturalist has mastered the subject beyond the line of some one narrow speciality. Synonymic lists for single species extending over several pages of an ordinary book are of no infrequent occurrence. See *synonymy*, 3.

The inconveniences arising from the want of a good Nomenclature were long felt in Botany, and are still felt in Mineralogy. The attempts to remedy them by *synonymies* are very ineffective, for such comparisons of synonyms do not supply a systematic nomenclature.

*Whewell*, *Philos. of Inductive Sciences*, I, p. lxxv.

II. *n.* One of the synoptic gospels; also, one of the writers of the synoptic gospels; a synoptist.

Yet the Tübingen professors and our Liberal newspapers must surely have something to go upon when they declare that the Jesus of the Fourth Gospel speaks quite differently from the Jesus of the *Synoptics*, and propound their theory of the Gnostic philosopher inventing, with profoundly calculated art, his fancy Gospel.

*M. Arnold*, *God and the Bible*, vi. § 5.

The real difference between John and the *Synoptics*, on this most decisive point, amounts to this: while these last have handed down to us but a single example of this form of language, John has preserved for us several examples selected with a particular purpose.

*Bibliotheca Sacra*, XLV. 733.

**synoptical** (si-nop'ti-kal), *a.* [*< synoptic + -al.*] Same as *synoptic*.—**Synoptical table**, in *nat. hist.*, a tabular synopsis of the leading, generally the most striking or easily recognized, characters of any group in zoology or botany, whereby the group is exhibited with a view to the ready identification of a given specimen, or analyzed to illustrate the relationship of its several components to one another. Such tables often proceed upon the dichotomous plan of presenting in succession alternatives of two (or more) characters, only one of which the specimen in hand should exhibit, as the "ovary inferior" and "ovary superior" in case of a plant; but the tabulation may be made in any way which best subserves the desired purpose in different cases. Some are natural analyses, others wholly artificial; the former are the more important and really instructive, the latter the most convenient and immediately helpful. Some combine these incompatible features as far as possible; and all are constantly used in systematic treatises, manuals, and text-books. They are often called *keys*.

**synoptically** (si-nop'ti-kal-i), *adv.* In a synoptical manner; in such a manner as to present a general view in a short compass.

Connected system or order; union of things.

The fifth [consideration] is concerning the *syntax* and disposition of studies, that men may know in what order or pursuit to read. *Bacon, Advancement of Learning*, ii.

2. In *gram.*, the construction of sentences; the due forming and arrangement of words or members of sentences in their mutual relations according to established usage. *Syntax* includes the proper use of parts of speech and of forms in their combinations to make sentences, and their proper arrangement or collocation.

**synthethermal** (sin-thér'mál), *a.* [*Gr. σύν, together, + θερμός, heat: see therm, thermal.*] Having the same temperature.

**synthesis** (sin'the-sis), *n.* [= *F. synthèse* = *Sp. síntesis* = *Pg. synthese*, *synthesis* = *It. sintesi*, *Gr. σύνθεσις*, *Gr. συνθιβάω*, a putting together, composition, *συνθιβάω*, put together, combine, *σύν*, together, + *τίθημι*, set, place: see *thesis*.] 1. A putting of two or more things together; composition; specifically, the combination of separate elements or objects of thought into a whole, as of simple into compound or complex conceptions, and individual propositions into a system; also, a process of reasoning advancing in a direct manner from principles established or assumed, and propositions already proved, to the conclusion: the opposite of *analysis*.

It [speech] should carry an orderly and good construction, which they called *Synthesis*. *Puttenham, Arte of Eng. Poesie*, p. 130.

Geometrical deduction (and deduction in general) is called *synthesis*, because we introduce, at successive steps, the results of new principles. But in reasoning on the relations of space we sometimes go on separating truths into their component truths, and these into other component truths, and so on; and this is geometrical analysis. *Whewell, Philoa. of Inductive Sciences*, II. xxiii.

2. Specifically—(a) In *gram.*, the combination of radical and formative elements into one word, as distinguished from their maintenance in the condition of separate words. See *synthetic*, 2. (b) In *surg.*, an operation by which divided parts are united. (c) In *chem.*, the uniting of elements into a compound; composition or combination: the opposite of *analysis*, which is the separation of a compound into its constituent parts; as, that water is composed of oxygen and hydrogen is proved both by analysis and by synthesis. (d) In *acoustics*, the combining of two or more simple sounds of different pitch, as those of several tuning-forks to produce or imitate a certain compound sound, as, for example, that of a piano-string.—*Dynamic, pure, etc., synthesis*. See the adjectives.—*Synthesis of apprehension*. See *apprehension*.—*Synthesis of reproduction*. See *reproduction*.

**synthesise**, *v. t.* See *synthesize*.

**synthesist** (sin'the-sist), *n.* [*Gr. synthes-is + -ist*.] One who employs synthesis, or who follows synthetic methods. Compare *syntheticist*.

Science turns her back on the subject, and the universities dismiss Art from the category of studies, and pass it over mainly to the painters to discourse on, ignoring the psychological law that no mind can be productively analytical and synthetic at the same time, and the artist, being perforce a *synthesist*, cannot be expected to analyse the art which he is, if a true artist, occupied in building. *New Princeton Rev.*, II. 23.

**synthesize** (sin'the-siz), *v. t.*; pret. and pp. *synthesized*, ppr. *synthesizing*. [*Gr. synthes-is + -ize*.] To combine or bring together, as two or more things; unite in one; treat synthetically. Also spelled *synthesise*.

The functions of separate organs are subsumed and *synthesized* into the activity of a yet higher unity—that of the organic system to which they belong. *Mivart, Nature and Thought*, p. 187.

**synthetic** (sin-thet'ik), *a.* [= *F. synthétique* = *Sp. sintético* = *Pg. sintetico* = *It. sintetico*, *Gr. συνθετικός*, skilled in putting together or in composition, *συνθιβάω*, put together: see *synthesis*.] 1. Of or pertaining to synthesis; consisting in synthesis: as, the *synthetic* method of reasoning, as opposed to the *analytical*.

In fact, all mathematical judgments are *synthetic*, or, if analytical judgments are made in mathematics, they are quite subordinate in importance. *E. Caird, Philoa. of Kant*, p. 211.

That activity which we variously call "poetic," "imaginative," or "creative" is essentially *synthetic*, is a process of putting together, while the scientific process seems distinctively analytic, or a tearing apart. *S. Lauer, English Novel*, p. 69.

2. In *gram.*, characterized by synthesis, or the combination of radical and formative elements into one word, as distinguished from their maintenance in separate words, which is *analytic*. Thus, *man's* is *synthetic*, of *man* is *analytic*; *higher* is *synthetic*, *more high* is *analytic*; *loved* is *synthetic*, *did love* is *analytic*: and so *amabitur* (Latin) and *will be loved*. The

epithet [used both of such formations, *IP*, those and of classes of expressions, as *that which language is a period or class of languages*, as being an expression of one or of the other] has prevailed in each case.

3. In *bot.*, of a general or comprehensive type of structure; combining in one organ such characters which are to be specialized in several different organisms in the course of evolution: generalized, not specialized; undifferentiated.

Thus the *Synghada* are a synthetic type, as containing characters of the classes *Muriopoda* and *Heuropoda*. Since the general course of evolution is from general to particular, or from generalization to specialization, synthetic forms are mostly low or primitive, and less fully illustrated by recent or living than by early and extinct organisms. Most fossil types are synthetic in comparison with existing forms of which they are ancestral.—*Synthetic geometry*, geometry treated without algebra, or at least without arithmetical; opposed to *analytical geometry*. Modern synthetic geometry, which has been almost altogether the fruit of the nineteenth century, resembles the geometry of the Greeks, but far surpasses it in power and beauty. In its simplest form it consists of a small cylindrical tube with an air-tight piston fitted with a rod and handle. The lower end of the cylinder terminates in a small tube; on this being immersed in any fluid, and the piston then drawn up, the fluid is forced into the body of the cylinder by the atmospheric pressure, and by pushing back the piston to the bottom of the cylinder the contained fluid is expelled in a small jet. The syringe is used by surgeons and others for washing wounds, for injecting fluids into the body, and for other purposes. A larger form is used for watering plants, trees, etc. The syringe is also used as a pneumatic machine for condensing or exhausting the air in a close vessel, but for this purpose two valves are necessary.

Pope, *Essay on Man*, l. 89.

Every work, both of nature and art, is a *system*; and, as every particular thing, both natural and artificial, is for some use or purpose out of and beyond itself, one may add to what has already been brought into the idea of a *system* its conduciveness to this or more ends. Let us instance in a watch. Butler, *Analogy*.

A Natural *System* is one which attempts to make all the divisions natural, the widest as well as the narrowest, and therefore applies no characters preëmporarily. . . . An Artificial *System* is one in which the smaller groups (the Genera) are natural, and in which the wider divisions (Classes, Orders) are constructed by the peremptory application of selected Characters (selected, however, so as not to break up the smaller groups).

Howell, *Philos. of Inductive Sciences*, I. p. xxxii.

For a *system*, in the most proper and philosophic sense of the word, is a complete and absolute whole.

H. Bushnell, *Nature and the Supernatural*, ii.

Star and *system* rolling past.

Tennyson, *In Memoriam*, Conclusion.

2. A plan or scheme according to which ideas or things are connected into a whole; a regular union of principles or facts forming one entire whole; an assemblage of facts, or of principles and conclusions, scientifically arranged, or disposed according to certain mutual relations so as to form a complete whole; a connected view of all the truths or principles of some department of knowledge or action: as, a *system* of philosophy; a *system* of government; a *system* of education; a *system* of divinity; a *system* of botany or of chemistry; a *system* of railroadings: often equivalent to *method*.

There ought to be a *system* of manners in every nation which a well-formed mind would be disposed to relish.

Burke, *Rev. in France*.

In the modern *system* of war, nations the most wealthy are obliged to have recourse to large loans.

A. Hamilton, *The Federalist*, No. 30.

There was no part of the whole *system* of Government with which they [the Houses of Parliament] had not power to interfere by advice equivalent to command.

Macaulay, *Sir William Temple*.

I am deeply convinced that among us all *systems*, whether religious or political, which rest on a principle of absolutism, must of necessity be, not indeed tyrannical, but feeble and ineffective *systems*.

Gladstone, *Might of Right*, p. 102.

3. The scheme of all created things considered as one whole; the universe.—4. Regular method or order; plan: as, to have no *system* in one's business or study.—5. In *astron.*, any hypothesis or theory of the disposition and arrangements of the heavenly bodies by which their phenomena, their motions, changes, etc., are explained: as, the Ptolemaic *system*; the Copernican *system*; a *system* of the universe, or of the world.—6. In the *fine arts*, a collection of the rules and principles upon which an artist works.—7. (a) In *Byzantine music*, an interval conceived of as compounded of two lesser in-

tervals, as an octave or a tetrachord. (b) In *medieval and modern music*, a series of tones arranged and classified for artistic use, like a mode or scale. (c) In *modern musical notation*, two or more staves braced together for concerted music.—8. In *anc. pros.*, a group of two or more periods; by extension, a single period of more than two or three cola; a hypermetron. A *system* the metrical form of which is repeated once or oftener in the course of a poem is called a *strophe*.

9. In *biol.*: (a) An assemblage of parts or organs of the same or similar tissues. The principal systems of the body in this sense are the *nervous*, both cerebrospinal and sympathetic; the *muscular*, both voluntary and involuntary; the *osseous*, including the cartilages as well as the bones of the skeleton; the *vascular*, including the *blood-vascular* and *lymphatic* or absorbent; the *tegumentary*; the *mucous*, including the mucous membranes; and the *serous*, including the serous membranes. These systems may be subdivided, as the vascular into the blood-vascular and lymphatic systems; or some of them may be grouped together, as when the *connective-tissue system* includes the bones, cartilages, ligaments, tendons, and general areolar or cellular tissues of the body. Hence—(b) In a wider sense, a concurrence of parts or organs in some function. Most if not all such systems act physiologically by the concurrence of several other lesser systems: as, the *digestive system*; the *respiratory system*; the *reproductive system*. Hence—(c) In the widest sense, the entire body as a physiological unity or anatomical whole: as, to take food into the *system*; to have one's *system* out of order. (d) In *ascidiology*, the cœnobium of those compound tunicates which have a common cloaca, as the *Botryllidæ*. Von Drasche, 1883.—10. One of the larger divisions of the geological series: as, the Devonian *system*; the Silurian *system*. The term is used by various geologists with quite different meanings, mostly, however, as the equivalent of *series*: thus, Cretaceous *system* (the Cretaceous series).

11. In *nat. hist.*: (a) In the abstract, classification; any method of arranging, disposing, or setting forth animals and plants, or any series of these, in orderly sequence, as by classes, orders, families, genera, etc., with due coordination and relative subordination of the several groups; also, the principles of such classification; taxonomy: as, the morphological *system*; a physiological *system*. There is but one adequate and natural system, namely, that which classifies animals and plants by structure alone, according to their degrees of genetic relationship, upon consideration of descent with modification in the course of evolutionary processes; it is the aim of every systematist to discover this true taxonomy and set it forth by classificatory methods. (b) In the concrete, any zoological or botanical classification; any actual arrangement which is devised for the purpose of classifying and naming objects of natural history; a formal scheme, schedule, or inventory of such objects, or a systematic treatise upon them: as, the Linnean or artificial *system* of plants; Cuvier's *system* of classification; the quinary *system*. Such systems are very numerous, and no two agree in every detail either of classification or of nomenclature; but all have in view the same end, which is sought to be attained by similar methods, and upon certain principles to which most naturalists now assent.—**Abkari system**. It was based on the assumption that the body possesses a peculiar property of excitability, and that every agent capable of acting on the body during life does so as a stimulant. When these stimuli were normal in amount, the condition was one of health; if excessive, causing debility; if insufficient, causing indirect debility.—**Canonical system**, a system of differential equations of the forms

$$dx_i = \frac{\partial \psi}{\partial p_i} dt, \quad dp_i = -\frac{\partial \psi}{\partial x_i} dt, \quad i = (1, 2, 3, \dots, n).$$

See *Linnean*. — **Logierian system**, in music, a system of instruction upon the pianoforte invented by J. B. Logier, and patented in England in 1814. It involved two things—the use of the chiroplast, a mechanical contrivance for holding the pupil's hands in a correct position at the keyboard, and the simultaneous instruction of several pupils at as many pianofortes. The chiroplast had drawbacks which have led to its being discarded, but the plan of class instruction is in use to some extent in all music schools. — **Lot, Macleayan, male, mark, mercantile, metamorphic, metayer, military, moiety, muscular, natural, nervous, octave system**. It is thus finally made positive that the *Taconic system* is not a pre-Silurian system, and that the claiming for it equivalency with the Huronian was but a leap in the dark. It is manifest, in fact, that "*Taconic system*," is only a synonym of the older term "*Lower Silurian*," as this term was used by geologists generally twenty, thirty, and forty years since, and by many writers till a much later date. *J. D. Dana, Amer. Jour. Sci.*, Dec., 1888, p. 411.

**Tail-rope, tarsal, territorial, tetragonal, etc., system**. See the qualifying words. — **Three-field system**. See *field*. — **Vascular system, the circulatory system, water-vascular system**. See *water-vascular*. — **System, 1-4. System, Method**. Strictly, "*System* is logical or scientific collocation. *Method* is logical or scientific procedure" (*C. J. Smith, Synonyms Discriminated*). But *system* is often used for *method*; *method* is not used for *system*. *System, Range, Chain, in orography*, as used by physical geographers writing in English, are nearly the same: thus, we find the "*Appalachian chain*" frequently called "*Appalachian range*" or "*ranges*," and also "*Appalachian system*." *System* is the more comprehensive term. All the *ranges* which go to make up a complex of mountains sufficiently nearly a unit, as popularly designated, to be embraced under one name, may be called a *system*: thus, the *ranges* of the Great Basin, some twenty or more in number, may properly all be classed together as forming the Great Basin "*mountain system*," or simply "*system*."

As thus defined, the Appalachian Region, *System*, or complex of *ranges*, extends from the promontory of Gaspe, in a mean direction of northeast and southwest, to Alabama—a distance of about 1,900 miles—where it disappears entirely, becoming covered by the much more recent geological formations, which form a broad belt along the Gulf of Mexico, and extend far up the Mississippi Valley. *J. D. Whitney, The United States*, p. 32.

**systematic** (sis-te-mat'ik), *a.* [= *F. systématique* = *Sp. sistemático* = *Pg. systemático* = *It. sistematico*, < *NL. systematics*, < *Gr. συστηματικός*, combined in one whole, systematic, < *συστημα* (-), a system; see *system*.] 1. tematic arrangement of plants or animals; a systematic course of study.

On the phenomena and circumstances of the syzygies depends a great part of the lunar theory.—2. In *anc. pros.*, a group or combination of two feet. Ancient metricians varied in their use of this term. Some use it regularly for a dipody or (dipodic) measure. Others call a tautopody, or double foot, a dipody, but a combination of two different feet a syzygy. Some, accordingly, giving the name *syzygy* to tetrasyllabic feet (regarded by them as composed of two dissyllabic feet), speak of an iambic or a trochaic line as measured by dipodies, but an Ionic line as measured by syzygies—that is, by single Ionics considered as combinations of trochees and pyrrhics. A peculiar use is the restriction of the term *syzygy* to compound feet of five or six syllables.

3. In *alg.*, a linear function in the variables. See *syzygetic*.—4. In *zool.*, the conjunction of two organs or organisms by close adhesion and partial concrescence, without loss of their identity; also, the thing so formed, or the resulting conformation; a syzygium: a term variously applied. (a) Zygosis or conjugation, as observed in various protozoans and other low organisms. See *conjugation*, 1, *Diplozoon*, and *diporpa*. (b) Suture, or fixed articulation, of any two joints of a crinoid ray, or the joints thus sutured, with partial obliteration of the line of union.

Syzygy of *Diplozoon paradoxum*.

The first of the brachial joints [in the *Pentacrinus asper*], that is to say, the joint immediately above the radial axillary—is, as it were, split in two by a peculiar kind of joint, called by Müller a "*syzygy*." All the ordinary joints of the arms are provided with muscles producing various motions, and binding the joints firmly together. The *syzygies* are not so provided, and the arms are consequently easily snapped across where these occur. *Sir C. Wyville Thomson*, *Depths of the Sea*, p. 440.

**Epirrhematic syzygy**, in *anc. pros.*, the last four parts of the parabasis—that is, the strophe or ode, epirrhema, antistrophe or antode, and antepirrhema; the choric as distinguished from the monodic parts of the parabasis.

**szaboite** (sab'ō-it), *n.* [Named after Prof. J. Szabo, of Budapest in Hungary.] A variety of hypersthene, first described erroneously as a new triclinic member of the pyroxene group.

**szaibelyite** (sā-bel'yit), *n.* [Named from *Szajbelyi*, a Hungarian.] A hydrous borate of magnesium, occurring in white nodules of acicular crystals in a gray limestone at Werksthal in Hungary.

1. The twentieth letter and sixteenth consonant of the English alphabet. Of the Phoenician alphabet the corresponding sign was the twenty-second and last; what follows *t* in Greek and Latin, and also in our own scheme, is the result of successive additions made to the system borrowed from Phoenician. (See the several letters below.) The comparison of forms (compare *A*) is as follows:

The value of the sign has been practically the same through the whole history of its use; it denotes the surd (or breathed) mute (or cheek) produced by a complete closure (with following breach or explosion) between the tip of the tongue and a point on the roof of the mouth either close behind or not far from the bases of the upper front teeth. Its corresponding sonant or voiced mute is *d*, and its nasal is *n* (see these letters). They are oftenest called *dental* or *teeth-sounds*, though the teeth have really no part in their production; hence also, and better, *lingual*, or *front* (*lingual*, or *linguist*), etc. They are much more common elements of our utterance than either of the other two classes, palatal (*k*, *g*, *ng*) or labial (*p*, *b*, *m*); they constitute, namely, about 18 per cent. of the sounds we make (*t* nearly 6 per cent., *d* nearly 5, *n* nearly 7), against palatal 4 per cent., and labial 6). A sound which our ears would at once recognize and name as a *t*-sound is producible in other positions of the organs than that described above—namely, at points further back on the roof of the mouth, and with parts of the tongue behind the tip, and even of its under surface. Hence the occurrence in some languages of more than one *t*, distinctly recognized as separate members of the spoken alphabet (so two in Sanskrit, etc., and even four in Siamese); our own *t* also which forms the first part of the compound *ch* (= *ts*) is slightly but constantly different from our *t* elsewhere. As in many other languages (and partly by direct inheritance from French, and even from later Latin, alterations), the *t* in English shows a tendency to become palatalized and converted into a sibilant when followed by palatal sounds, as *t*, *e*, *y*. Hence, in many situations, it combines with such sounds, either regularly or in rapid utterance, producing the *ch*-sound, as in *question*, *mixture* (compare the corresponding conversion of *s* to *sh*, under *S*); and even, in a great number of words having the endings *-tion*, *-tion*, *-tion*, etc., it becomes a sibilant and makes the *sh*-sound, as in *nation*, *faction*, *partial*, etc. *T* also, like others of our consonants, frequently occurs double, especially when medial: thus (from *fit*) *fit*, *fit*, *fit*. With *h*, *t* forms the digraph *th*, which has the position and importance of a fully independent element in the alphabet, with a double pronunciation, surd and sonant (or breathed and voiced); surd in *thin*, *breath*; sonant in *this*, *breath*. Both as strictly unitary sounds as *t* and *d*, or *s* and *z*. They are related with *t* and *s*, etc., as tongue-tip sounds, especially with *s* and *z* as being fricative and continuant; but they are of closer position than the latter, the closest that can be made without actual stoppage of the breath, and are usually formed with the tongue thrust further forward, against or even beyond the teeth: hence their substitution for *s* and *z* by persons who lisp. In regard to their grade of closure, they are akin to *p* and *v*, and belong in one class with these (oftenest and best called *spirants*). As an *f* comes in part from an aspirated *p*, or *ph*, so also the *th*-sounds from an aspirated *t*; and in this way they have obtained their usual representation: the Greek *θ*, which was an aspirated *t* (that is, a *t* with separately audible *h* after it), was written in Latin with *th*, and then, when the aspirate came to be pronounced as a spirant, this was continued in use as representative of the latter. And in this case the Latin digraph has crowded out of English use the sign (or rather the two signs) which in Anglo-Saxon represented the *th* sounds—namely, *þ*, *ð*—much to the detriment of our present alphabet. Of the two *th*-sounds, the sonant (or *this* and *breath* sound) is much the more frequent, owing chiefly to the constant recurrence of the pronominal words, particularly *the*, in which it is found; it is nearly 4 per cent. of our utterance, while the surd (or *thin* and *breath* sound) is less than two thirds of one per cent. In the phonetic history of the Germanic part of our language, regularly and usually (when special causes do not prevent) comes from an older *d*; and, on the other hand, *th* from an older *t*: examples for *t* are two corresponding with *duo*, *eat* with *ad* or *ed*; for *th*, *thou* = *tu*, *three* = *tri*, *beareth* = *fert*; for both together, *that* = *tad*, *tooth* = *teat*.

2. As a medieval numeral, 160; with a line over it (*T*), 160,000.—3. (c) Of *Turkish*.—To a *T*, exactly; with the utmost exactness; as, *to* or *to* *T*. The confusion is probably to a misreading of *T* square, by which accuracy in making angles etc. is secured. (See *log*.)

(Leach, 1819), < *Tabanus* + *-idae*.] A large family of biting flies, of which *Tabanus* is the typical genus; the gadflies, breezes, or clegs, having the third joint of the antennæ annulate and without a distinct bristle. The proboscis of the female is adapted for piercing, and inflicts a painful although not irritating wound. The male does not bite. They fly with extraordinary speed, and the swiftest horse cannot elude them. The spindle-shaped brown or black eggs are attached in groups to the stems and leaves of low-growing plants, and the larvae are either aquatic or live in damp earth. They are predaceous, and feed upon snails or small insects. The young larvae of many species penetrate beetles and other larvae, and remain within until they have entirely consumed them. Over 1,300 species are known; 150 are North American. Many of them are among the largest and most powerful of the *Diptera*, but most are of moderate size. They fly in bright sunny weather. Also *Tabanides*. See cuts under *breeze*, *Chrysops*, and *gadfly*.

They are large, naked flies of brownish black or gray color, often having yellowish red spots on the sides of the abdomen. All the females bite severely. The larvae are found in damp earth and under fallen leaves and bits of wood and are carnivorous, some feed on earthworms and other small invertebrates. Nearly 100 species inhabit North America. *T. atratus* is the common large black horse-fly of the United States; *T. borealis* is the common gadfly of cattle. See cuts under *breeze* and *gadfly*.

forms, prob. adapted from Hind.] A white opaque or translucent variety of opal which breaks into irregular pieces like dry starch, found in the joints of the bamboo in the East and Brazil, and believed to be caused by disease or injury to the plant. It is probably the "oculus mundi" of the gem-writers of the sixteenth, seventeenth, and eighteenth centuries. petalous plants, of the order *Bignoniaceae*, tribe *Teocmeae*, and section *Digitifoliae*. It is characterized by loosely racemose or cymose flowers with a tubular and at length variously ruptured calyx, an elongated and greatly enlarged corolla-tube, four perfect stamens, and a sessile ovary ripening into a somewhat cylindrical ecostate capsule with numerous flat seeds, each with a large hyaline wing. There are about 60 species, natives of tropical America from Brazil to the West Indies and Mexico. They are erect shrubs or trees, smooth or hairy, often drying black. They bear usually large flowers and alternate or scattered leaves, which are generally composed of five to seven digitate leaflets, sometimes reduced to three or to one. Several species are used medicinally, as *T. impetiginosa*, which yields a bitter mucilaginous bark and abounds in tannin. Many are valuable trees, yielding an almost indestructible timber; several are known in tropical America as *roble* — that is, *oak* — and are used for house- and ship-building, or for making bows, as *T. toxophora*, the *pao-d'arco* of Brazil. The names *whitewood* and *boxwood* are given to *T. leucocylon* in the West Indies, and the former name also to *T. pentaphylla*; both are timber-trees with whitish bark and white or pink flowers. *T. serratifolia*, a small tree with yellow flowers, is known as *pony* in Trinidad. All the above species were formerly classed under *Teocoma*, but are removed to *Tabebuia* on account of their digitate, not pinnate, leaflets. A very different species, *T. uliginosa*, a shrub with simple entire leaves, is known as *Brazilian cork-tree*, from the use of its soft wood.

2 Pet. i. 13, 14.

*3.* In *Jewish hist.*, a tent constructed to serve as the portable sanctuary of the nation before its final settlement in Palestine. This "tabernacle of the congregation" is fully described in Ex. xxv.-xxvii. and xxxvi.-xxxviii. It comprised, besides the tent, an inclosure or yard, in which were the altar of burnt-offerings and the laver. The tabernacle proper was a tent divided into two chambers by a veil — the inner chamber, or holy of holies, containing the ark of the covenant and the mercy-seat, and the outer chamber the altar of incense, the table of showbread, and the golden candlestick. The tabernacle was of a rectangular figure 45 feet by 15, and 15 feet in height. The court or yard was 150 feet in length by 75 feet, and surrounded by screens 7½ feet high. The people pitched round the tabernacle by tribes in a fixed order during their wanderings, and the pillar of cloud and of fire, denoting Jehovah's presence, rested upon it or was lifted from it according as they were to remain stationary or were to go forward. After the arrival in the promised land it was set up in various places, especially at Shiloh, but gradually lost its exclusive character as the center of national worship before the building of Solomon's temple, in which its contents were eventually placed.

And he spread abroad the tent over the *tabernacle*, and put the covering of the tent above upon it. Ex. xl. 19.

And they brought up the ark [to the temple built by Solomon], and the *tabernacle* of the congregation [tent of meeting, R. V.], and all the holy vessels that were in the *tabernacle*, these did the priests and the Levites bring up. 2 Chron. v. 5.

Hence — *4.* A place or house of worship; especially, in modern use, an edifice for public worship designed for a large audience: often now the distinctive name assumed for such an edifice.

The shed in Moorfields which Whitefield used as a temporary chapel was called "The *Tabernacle*"; and, in the scornful dialect of certain Church-of-England men, Methodist and such-like places of worship have, since then, been known as *tabernacles*.

F. Hall, False Philol., p. 24, note.

*5.* A receptacle for the reserved eucharist; especially, a constructional receptacle for this purpose, containing the pyx. The tabernacle, as now commonly seen in Roman Catholic churches, is a recess with a door, placed over and behind the high altar or one of the side altars, usually having over it a cross or crucifix with a design in relief, the whole surmounted by a canopy. In earlier times a movable ark, or usually a suspended dove (columba) or a tower, held the eucharist or the vessel containing it. In England the general medieval custom was to place the sacrament in an ambry on one side of the sanctuary or in the sacristy. The tabernacle is a later development of the ark or ambry as a permanent construction over the high altar and surmounted by a canopy or ciborium, often in the spire-like shape developed from the older tower; hence the name *tabernacle* is often given especially to this canopy or to canopies of similar appearance.

**Tabernæmontana** (tā-bér'nē-mon-tā'nā), *n.* [*NL.*, named after Jacobus Theodorus *Tabernæmontanus*, a German physician and botanist (died 1590).] A genus of gamopetalous plants, of the order *Apocynaceæ* and tribe *Plumeriæ*, type of the subtribe *Tabernæmontanæ*. It is characterized by cymose flowers, a calyx furnished at the base of its five lobes with a continuous or interrupted ring of glands, and a fruit of two many-seeded berries or fleshy follicles which are large and globose or smaller and oblique or recurved. There are about 150 species, widely scattered through tropical regions. They are trees or shrubs, commonly smooth, bearing opposite thin or coriaceous feather-veined leaves. The small cymes of white or yellowish salver-shaped flowers are terminal or variously placed, but not truly axillary. The smooth or three-ribbed pulpy fruit contains several or many ovoid or oblong seeds with fleshy albumen: in several species it is ornamental in *T. macrocarpa* and others of the section *Rejous*, mainly of the Malay archipelago, resembling a reddish orange in appearance. Instead of the acrid, drastic, and poisonous milky juice of most related genera, many species of *Tabernæmontana* secrete a bland and wholesome fluid, sometimes useful as a nourishing drink, as in *T. utilis*, the cow-tree or hya-hya of British Guiana, which yields a thick, sweet, white liquid, made somewhat sticky by the presence of caoutchouc. This species also yields a soft white wood and a medicinal bark. *T. orientalis*, the Queensland cow-tree, and *T. coronaria*, known as *Adam's apple* or *East Indian rose-hay*, are sometimes cultivated, forming small evergreen trees, the latter under glass and also naturalized in tropical Asia from the Cape of Good Hope. Several other species are cultivated under glass for their large fragrant flowers and ornamental deep-green leathery leaves. *T. crassa*, the kpopoka-tree of Sierra Leone, produces a fiber there made into a cloth known as *dado-cloth*. A species in Ceylon, known as *dritadner*, probably *T. dichotoma*, has been called *forbidden fruit*, from its beautiful but poisonous fruit bearing marks fancied to be the prints of the teeth of Eve.

4. In music: (a) The system of rules for the poetry of the mastersingers. (b) Musical notation in general. (c) A form of musical notation for various instruments, like the lute, the viol, the flute, the oboe, or the organ, used in Europe from the fifteenth to the beginning of the eighteenth century. It differed from the more general staff-notation in that it aimed to express not so much the pitch of the tones intended as the mechanical process by which on the particular instrument those tones were to be produced. *Tablature*, therefore, varied according to the instrument in view. In the case of the lute, for example, a horizontal line was usually drawn for each string, forming a kind of staff; and letters or numerals were placed on these lines, indicating not only which strings were to be touched, but at what frets they were to be stopped. Various arbitrary signs were also used instead of letters or numerals, or in combination with them. Music thus noted was said to be written *lyra-icay*, in distinction from *gamut-icay* (in the staff-notation). In the case of wind-instruments, like the

flageolet, points or dots were often placed on a horizontal line to indicate which finger-holes were to be closed to produce the required tones. In the case of stringed instruments were often written out by their letter-names. In all these systems and their numerous variations, notes were placed above or below to indicate the position of the tones, the place and direction of the bow, and other details of style. *Tablature* has obviously been regarded as a notation for particular instruments. Various other musical notes now used are either derived from it, or are based on the same principle. The term *tablature*, therefore, that it thorough-bass, and the little used systems of notation or character notes are essentially and genus of it. Also *tablature*.

It has been sanctioned for official valuations in Massachusetts and (after the end of 1891) in California.—Conversion *table*, in *math.*, a table for converting measures from one system of units to another, or a table for changing measures expressed in one system of units into their numerical equivalent in another system of units.

—Moving *table*, in machines for grinding sheet-glass, a large rectangular paneled frame, working horizontally, and pivoted centrally to an oscillating arm which has at the other end a fixed bearing. It receives motion from a crank and pitman, the latter being pivoted to the moving *table* at a considerable distance from the first-named pivot. This arrangement produces a motion of the *table* analogous to that of hand-rubbing. The moving *table* is weighted on the upper side, and faced on the under side with slate, and it works over a large flat bed. In use, a plate of glass is cemented to the slate face of the moving *table* and another to the bed. The upper plate is then rubbed upon the lower, the grinding commencing with the use of coarse emery. This is succeeded by the use of finer grades. The final polishing is done by another process.—Multiplication *table*. The leaves, when raised, were supported originally by a sort of frame, swinging on a hinge or on pivots, and with a leg reaching the floor, thus making an additional leg of the *table* for each of the leaves. For this movable frame a hinged or sliding bracket is now often substituted.—Pillar-and-claw *table*, a table with a central support like a pillar, to the top of which the slab or top of the *table* is usually hinged: the pillar rests on three, four, or more feet, originally carved to represent the paws and claws of animals.—Pythagorean *table*. (b) A body of knights fabled to have been brought together by King Arthur Pendragon to defend Christian England and Wales against the heathen Saxons. This legendary order of Knights of the Round *Table* was imitated in later times by associations of participants in jousts or tournaments.

II. *n.* 1. Among the Polynesians and other races of the South Pacific, a system, practice, or act whereby persons, things, places, actions, or words are or may be placed under a ban, curse, or prohibition, or set apart as sacred or privileged in some specific manner, usually with very severe penalties for infraction. Taboo rests primarily upon religious sanctions, but is also a civil institution; and a taboo may be applied in various ways by a priest or a chief, or even sometimes by a private person, though with limited effect. Some taboos are permanently established, especially those affecting women; a special taboo may affect any of the relations or doings of life, or any subject animate or inanimate, either permanently or for a fixed period. As an institution, taboo has ceased or is dying out in most of the regions mentioned, though European influence; but both the principle and the practice have existed or still exist to some extent, under different names, among primitive peoples generally.

The most important *tacamahac* is derived from *Calophyllum Inophyllum*, of the East Indies, Polynesia, etc. (see *tamanu*), of which the *C. Tacamahaca* of Madagascar and the isle of Bourbon is a variety. The resin is of a greenish-yellow color, liquid at first, but hardening into a brittle aromatic mass soluble in alcohol and ether.

It exudes spontaneously or through incisions from the bark and roots. A similar gum is afforded by *C. Calaba* in the West Indies. The South American *tacamahac* is the product of *Bursera* (*Myrsine*) *tomentosa* and *B. excelsa*, of *Protium* (*Iceia*) *heptaphyllum*, and perhaps of other trees.

The buds of *Populus balsamifera* (see def. 2) are varnished with a resin which may be included under this name, occasionally used in the place of turpentine and other balsams.

It comprises nine tropical species, of which three are American, the others of the Old World. They are perennial herbs from a tuberous or creeping rootstock, with large radical leaves which are entire, lobed, or dissected, and a dense umbel of brown, lurid, or greenish flowers terminating in an erect leafless scape, and involucre with an exterior row of herbaceous or colored bracts. The numerous inner bracts are long, filiform, and pendulous, and have been erroneously regarded as sterile pedicels. *T. pinnatifida*, the plant or Otahite salep-plant, yields a nutritious starch, the South Sea arrowroot. (See *piä*.) Its leafstalks are boiled and eaten in China and Cochinchina; in Tahiti they are dried and plaited into bonnets. Other species, thought to be valuable as starch-plants, occur in Australia, India, Madagascar, Guinea, and Guiana. Several species were formerly separated as a genus *Ataccia* (K. B. Presl, 1830), having entire leaves and a spreading perianth.

The mercury in the tube descends at the same time, and the degree of this descent is measured by a scale attached to the tube. The velocity of the machine being lessened, the mercury rises in the center, causing a proportionate rise in the tube. (b) An instrument for measuring the velocity of running water in rivers, etc., as by means of its action on a flat surface connected with a lever above the surface carrying a movable counterpoise, or by its action on the vanes of a wheel, whose revolutions are registered by a train of wheelwork; a current-measurer. It is characterized by usually radiate flower-heads with a pappus of five or six awns, and surrounded by a single row of equal involucre bracts which are connate into a more or less lobed cup or cylinder, and are dotted with oily glands. There are about 20 species, natives of America from Buenos Ayres to Mexico. **tail-coverts** (tāl'kuv'erts), *n. pl.* The feathers overlying or underlying the rectrices of a bird's tail; the tectrices of the tail; the calypteria. These coverts are divided into superior and inferior, or upper and under coverts. They are commonly short, covering only the bases of the rectrices, but sometimes extend far beyond them; the gorgeous train of the peacock, for example, consists of tectrices, not rectrices, as is also the case with the beautiful train of the paradise trogon. The ornamental feathers called *marabout-feathers* are the under tail-coverts of a species of stork, and in certain other storks these coverts simulate rectrices. See *diagram under bird<sup>1</sup>*, and *cuts under peafowl*, *Pelargomorphæ*, *Tenipopygia*, and *trogon*.

**tail-feather** (tāl'feth'ēr), *n.* One of the feathers of a bird's tail; specifically, the rectrices, or rudder-feathers, usually stiff pennaceous feathers, always devoid of a hyporachis, as distinguished from the tectrices or tail-coverts. Tail-feathers, like flight-feathers, have for the most part a wide inner and narrow outer vane, and when the tail is closed or folded they overlap one another alternately from side to side. The two middle feathers, whose webs are more nearly equal, and which overlap all the rest, are sometimes distinguished as *deck-feathers*. Tail-feathers are always paired, and hence of an even number. The number prevailing among birds is 12; this is characteristic, having few exceptions among all *Passeres*, whether oscine or clamaratorial, and among many other birds, as birds of prey. In picarion birds 10 is the rule, though many have 12, and a few only 8; woodpeckers have 12, though apparently 10, one pair being rudimentary. In pigeons the rule is 12 or 14; sometimes there are 16 or 20. In gallinaceous birds the numbers run from 12 to 18 or 20. Waders have usually 12, often more, up to 20. Swimming-birds have sometimes only 12, usually higher numbers, as 16, 18, 20, 24, or even 32. The ardeopteryx appears to have had 40. In a few birds the tail-feathers proper are extremely modified, as in the lyre-bird. (See *Menura*, *Trochilidae*.) Tail-feathers which project far beyond the rest are said to be *long-exserted*. Shapes of individual rectrices are described as *truncate*, *incised*, *linear*, *acute*, *acuminate*, *filamentous*, *spatulate*, *micronate*, etc. (See these words.) The relative lengths of rectrices go far to determine the shape of the tail as a whole, which is usually in the form of a fan. The termination of the tail is described as *even*,

*truncate, acute, acuminate, cuneate, forked, forficulate, furcate, emarginate, rounded, double-rounded, double-forked, etc.* When the tail feathers of opposite sides come together vertically, as in the rare but familiar case of the barn yard fowl, the tail is said to be *complicate* or *folded*. The same tendency in the reversed direction results in the *scaphoid* or *boat-shaped* tail. A tail-feather spatulate at the end is called a *racket*. Some tail-feathers are coiled, *circinate* or *scapoid*; others form a lyrate figure. A few birds, as grebes, have only rudimentary or no proper tail-feathers. The word is loosely extended to include tail-coverts in some cases. See cuts under *boat-shaped*, *Cuculinarus*, *lyre bird*, *Saypho*, *Spathura*, and *Topaza*.

In *surg.*, same as *tail*<sup>1</sup>, 5 (*c.*)—3. *pl.* The parts or a part of any incoherent or fluid material separated as refuse, or separately treated as inferior in quality or value; leavings; remainders; dregs. The tailings of grain are the lighter kernels blown away from the rest in winnowing; of flour, the inferior kind separated from the better in bolting. Tanning-liquor that has become "sour" or impure is called *tailings*. In metallurgy tailings are the part rejected in washing an ore that has passed through the screens of a stamp-mill, the worthless slime left after the valuable portion has been separated by dressing or concentration. The part rejected as tailings may, however, at a future time be worked over and made to undergo still further concentration. The sand, gravel, and cobbles which pass through the sluices in hydraulic mining were formerly generally designated as *tailings*; of late years, and especially in State and United States legislative documents, they have been called "mining debris" or simply "debris."

The refuse material thrown aside in quartz, drift, hydraulic, or other mines, after the extraction of the precious metal, is called *tailings*. The tailings from hydraulic mines are called "debris" also.

**tailor-bird** (tāl'or-bēr'd), *n.* One of various small passerine birds of the Oriental or Indian region, noted for the ingenuity with which they sew leaves together to form a nest. These birds are a sort of grass-warblers, grouped under the name *Cisticole*. They belong to such genera as *Sitta*, *Suthora*, *Prinia* (with only ten tail-feathers, contrary to the rule in *Passeres*), and especially to *Suthora* and *Orthotomus*. There are many species, some now placed in other genera. The original tailor-warbler of Latham (1783) was based upon a bird first described by For-

ster in 1781 as *Motacilla sutoria*, and given a such name by Sonnerin in 1782, with reference to the two tail-feathers. These descriptions furnish the original species long known as *Suthora sutoria* and *S. longicauda* respectively, till Horsford in 1836 founded a new genus upon *O. sutoria*, after which the original warbler was usually placed in *Orthotomus*, and from the course of time several other specific designations. In 1861 Nicholson founded the genus *Sutoria* upon the original type species of Forster, Sonnerin, and Latham; and in 1881 Lesson founded a nominal genus *Edela* upon a species of *Orthotomus*. The result of this by no means remarkable confusion in generic names is that the species of *Sutoria* proper have usually been called *Orthotomus*. (a) There are 3 species of *Sutoria*, or tailor-birds proper: *S. sutoria* or *S. longicauda* (mostly called *Orthotomus sutorius* or *O. longicauda*), throughout India and Ceylon, in parts of China in Formosa, Hainan, etc.; *S. sula* of Java; and *S. maculicollis* of the Malay peninsula. (b) There are 10 or 12 species of *Orthotomus* proper, ranging from the Burmese countries and the Malay peninsula to Java, Sumatra, Borneo, and the Philippines. See also cuts under *Sutoria* and *Orthotomus*.

In *classical myth.* and *archæol.*, the sandals, bearing small wings, worn characteristically by Hermes or Mercury and often by Iris and Heos (Dawn), and by other divinities, as Eros and the Furies and Harpies. In late or summary representations of the deity the sandals are sometimes omitted, so that the wings appear as if growing from the ankles, one on each side of the foot. Sometimes, especially in archaic examples, the talaria have the form of a sort of greaves bearing the wings much higher on the leg. They symbolize the faculty of swift and unimpeded passage through space.

**talaric** (tā-lar'ik), *a.* [*< L. talaris*, of or pertaining to the ankle: see *talaria*.] Pertaining to the ankles: especially in the phrase *talaric chiton* or *tunic*, of Greek antiquity—that is, one reaching to the ankles or feet, as the long tunic of the Ionian Greeks.

**talbot** (tāl'bot), *n.* [Probably from the *Talbot* family, who bear the figure of a dog in their coat of arms.] 1†. A kind of hound, probably the oldest of the slow-hounds. This dog had a broad mouth, very deep chops, and very long and large pendulous ears, was fine-coated and usually pure-white. This was the hound formerly known as St. Hubert's breed, and is probably the original stock of the bloodhound.

Jesse says the earliest mention of bloodhounds was in the reign of Henry III. The breed originated from the *talbot*, which was brought over by William the Conqueror, and seems to have been very similar to the St. Hubert.

*The Century*, XXXVIII, 189.

2. In *her.*, a dog, generally considered as a mastiff, represented with hanging ears, and tail somewhat long and curled over the back: it is represented walking unless otherwise blazoned.

Its prevailing colors are white, apple-green, and yellow. There are three principal varieties of talc—foliated, massive (including soapstone or steatite), and indurated. Indurated talc is used for tracing lines on wood, cloth, etc., instead of chalk. Talc is not infrequently formed by the alteration of other minerals, particularly the magnesian silicates of the pyroxene group; thus, *rensselaerite* is talc pseudomorphous after pyroxene, and a fibrous form of talc (sometimes called *pyralite*), pseudomorph after enstatite, is found at Edwards, New York, and when finely ground is used in giving a gloss to paper. Talc is also used as a lubricator, and steatite or soapstone for hearthstones, etc.

These have been called by Dana *hydro-mica-schista*. *Talc-schist* is not specially abundant, though it occurs in considerable mass in the Alps (Mont Blanc, Monte Rosa, Carinthis, etc.), and is found also among the Apennine and Ural Mountains.

Pg. It. *talento*, a talent, also will, inclination, desire, = D. G. Sw. Dan. *talent*, gift, endowment, = Ir. *talaint*, a talent, *talān*, Gael. *talann*, a talent, faculty, < *L. talentum*, a Grecian weight, a talent of money, ML. also will, inclination, desire, < Gr. *τάλαντον*, a balance, a particular weight, esp. of gold, a sum of money, a talent (see def.), < *√ tal*, *τᾶλ*, lift, bear, weigh, as in *τᾶλνα*, bear, suffer, *τᾶλμα*, miserable, *ἀτᾶλτος*, much-suffering, *ἄτλας*, Atlas (see *Atlas*), *L. tollere*, lift, *tolerare*, bear (see *tolerate*), Skt. *talā*, a balance, weight, *tu-lana*, lifting, *√ tul*, lift, weigh. The deflected uses of the word in ML. and Rom. are due in part to the fig. sense 'wealth,' and in part to the sense 'gift, endowment,' suggested by the parable of the talents (Mat. xxv.).] 1. An ancient denomination of weight, originally Babylonian (though the name is Greek), and varying widely in value among different peoples and at different times.

All the Assyrian weights had two values, the heavy being double the light, and there were also various types of each. The royal Babylonian commercial talent (or Assyrian talent) was divided into 60 minas, and each mina into 60 shekels. Its value (light weight) was in one type 29.63 kilograms (65 pounds 5 ounces avoirdupois), and in another 30.10 kilograms (66 pounds 5½ ounces). Derivatives of this talent (which was equivalent to 3,000 shekels) were in use in Syria and Palestine and in Phœnician colonies. Its money value is reckoned as approximately from \$1,700 to \$2,000. The Babylonian gold talent contained only 50 minas, and was thus five sixths of the commercial weight. The Babylonian silver talent was formed by multiplying the commercial talent by 1¼ (the ratio of silver to an equivalent mass of gold), and afterward dividing by 10. The resulting light talent was sometimes again divided by 2. Derivatives of this talent were in use in Persia, Lydia, Macedonia, and Italy. It is the basis of much of the most ancient silver coinage. The Phœnician silver talent, probably derived from the Babylonian, was in its lighter types about 43.4 kilograms (95 pounds 9 ounces avoirdupois), and being halved, was adopted into the Ptolemaic system. The chief Greek talents were as follows: Old Æginetan, 40.3 kilograms (88 pounds 12 ounces); emporic Attic (substantially later Æginetan), 36.4 kilograms (80 pounds 4 ounces); Solonic (= Egyptian), 25.8 kilograms (56 pounds 14 ounces). Talents mentioned by Homer and some of the oldest writers appear to be small weights, perhaps shekels. The later Attic talent contained 60 minas, or 6,000 Attic drachmas, equal to 56 pounds 14 ounces. As a denomination of silver money it was equal to about \$1,000. The great talent of the Romans is computed to be equal to £99 6s. 8d. sterling, or about \$480, and the little talent to £75 sterling, or about \$363.

= *Syn.* 1 and 2. *High, Tall, Lofty*. *High* is the most general of these words, and has some uses different from those of the others. When we say that a cloud is *high*, we may mean that it extends very far upward, or, more probably, that it is unusually far above the earth. *Tall* describes that which is slim in proportion to its height, as a mast, a pine or other tree, a steeple, a person, possibly a cliff: *tall* houses may be found in some parts of the world; a *tall* cloud would be of small width and great comparative height. *Tall* is also associated with height to which we are used or which we have come to regard as standard. A giant is *tall*, because so much *taller* than most men. *Lofty* denotes an imposing height: a room cannot well be *tall*, but may be *high*, or even *lofty*: as, the *lofty* arches of Westminster Hall. *High* and *lofty* may have application to moral or intellectual character: *tall* has not, except colloquially. *Tall* seems somewhat figurative when applied to that which does not live and grow.

These fats are mostly of animal origin, the most common being derived from sheep and oxen. When pure, animal tallow is white and nearly tasteless; but the tallow of commerce usually has a yellow tinge. All the different kinds of tallow consist chiefly of stearin, palmitin, and olein. In commerce tallow is divided into various kinds according to its qualities, of which the best are used for the manufacture of candles, and the inferior for making soap, dressing leather, greasing machinery, and several other purposes. It is exported in large quantities from Russia.

In India and England it is more or less applied to lubricating, soap-making, etc. Malayan vegetable tallow is derived from the nuts of several species of *Hopea*, and is used chiefly for cooking, but somewhat for lighting. **tally<sup>1</sup>** (tal'i), *n.*; pl. *tallies* (-iz). [Formerly also *tallo*; *< ME. talay, talge*, a later form of *taille*, *taille*, *taille*, etc., a cutting, a cut, etc.: see *tail<sup>2</sup>*.] 1. A piece of wood on which notches or scores are cut to mark numbers, as in keeping an account or giving a receipt; loosely, anything on which a score or an account is kept.

Before the use of writing, or before writing became general, this or something like it was the usual method of keeping accounts. In purchasing and selling it was customary to make duplicate tallies of the transaction, or to split one tally through the middle. In the English Exchequer tallies were used till 1812, which answered the purpose of receipts as well as simple records of matters of account. An Exchequer tally was an account of a sum of money lent to the government, or of a sum for which the government would be responsible. The tally itself consisted of a squared rod of hazel or other wood, having on one side notches indicating the sum for which the tally was an acknowledgment. On two other sides, opposite to each other, the amount of the sum, the name of the payer, and the date of the transaction were written by one scribe, and the counter of the tally was written by another. The rod was then cleft longitudinally in such a manner that each piece retained one of the written sides, and one half of every notch cut in the tally. One of these parts, the *counter*, was kept in the Exchequer, and only the other, the *stock*, issued. When the *counter* was returned to the Exchequer, it was compared with the *stock*, and the two parts were compared, as a check against fraudulent imitation. This was called *tallying*. The use of the tally was discontinued in 1812, and was replaced by the receipt. The receipt was a small slip of paper, the breadth of a thumb; for £1 the breadth of a barleycorn. A receipt was issued for each pound.

Alas! I cannot pay a jot; therefore  
I'll kiss the tally, and confess the score.  
*Herrick, To Good.*

Between two equal Fanniers sway'd?

But, forc'd from this unactive State, . . .  
On either side you hear 'em clatter.

3. A mark made to register a certain number of objects; one of a series of consecutive marks by which a number of objects are recorded or checked; also, a number as thus recorded; a number serving as a unit of computation. Thus, when packages of goods of uniform size and character are being delivered and an account of them taken, every fifth mark usually is called *tally*, and in counting aloud the word *tally* is used instead of five, after which the enumeration begins again; this is marked on a clerk's book, *tally* being the diagonal mark; though sometimes each mark is a *tally*, and the fifth or diagonal one is a *tally of tallies*.

At many pits it is customary to send the tubs of coals to bank with tin *tallies* attached, each *tally* bearing the number of the "bank" or "benk," where the coal has been got in the mine. The fruit is a flat thickened pod, 3 to 6 inches long, with a brittle brown shell containing a fibrous juicy pleasantly acid pulp inclosing the seeds. The pulp is used in hot countries to make cooling drinks, and preserved in syrup or sugar, or alone, it forms the tamarinds of commerce. It is used also in preparing tamarind-fish. It is officinally recognized as a refrigerant and laxative. Besides the pulp, the seeds, flowers, leaves, and bark all have their medicinal applications in India or elsewhere. The leaves in India form an ingredient in curries. The wood is very hard and heavy, yellowish-white in color with purple blotches, and is used in turnery.—**Bastard tamarind**. A genus of leguminous plants, of the suborder *Casalpiniæ* and tribe *Amherstieæ*. It is characterized by flowers with colored caducous bracts, four sepals, three perfect and two rudimentary petals, three perfect monadelphous stamens, and a few staminodes in the form of minute teeth; and by the fruit, a thick indehiscent legume with a fragile crustaceous epicarp, pulpy mesocarp, and thick coriaceous endocarp forming partitions between the seeds. The only species, *T. Indica*, is widely diffused through the tropics, indigenous in Africa and Australia, and naturalized from cultivation in Asia and America. It is a tree bearing abruptly pinnate leaves, with many pairs of small leaflets, and yellow and red flowers in terminal racemes. See *tamarind*.

Besides the type, *Tamarix*, it includes the genus *Myricaria*, comprising a few similar but smaller European and Asiatic species growing in sand.

**Tamariscinæ** (tam'a-ris'in'ë-ë), *n. pl.* [NL. (A. N. Desvaux, 1815), < *Tamariscus* + *-inæ*.] An order of plants, the tamarisk family, of the series *Thalamifloræ* and cohort *Caryophyllinæ*. It is characterized by usually shrubby stems clothed with small undivided alternate leaves, and by flowers with five or more stamens, a one-celled ovary with three to five placentæ, and the sepals and petals free or more or less united. It includes about 45 species, belonging to 5 genera classed in 3 tribes, for the types of which see *Tamarix*, *Reaumuria*, and *Fouquieria*. They are natives of temperate and warmer regions of the northern hemisphere and also of South Africa, occurring mostly in maritime salt-marshes or in sands and gravelly places among mountains. Unlike the related *Caryophyllaceæ*, or pink family, the seeds are either pilose, comose, or winged, which, together with the frequent willowy habit and narrow leaves, has suggested a superficial resemblance to the order *Salicinæ*, the willow family. Many species have also been compared to the cypress, from their appressed scale-like leaves and tall slender stems. They are shrubs, rarely herbs or trees, their leaves commonly somewhat fleshy, and their flowers either small or showy, usually flesh-colored, pink, or white.

A plant of the genus *Tamarix*: sometimes called *flowering cypress*. The common tamarisk is *T. Gallica*, a shrub or small tree of the Mediterranean region and southern Asia. It is a prized ornamental shrub of feathery aspect, with scale-like leaves, and bearing clouds of pink flowers in late summer. It is a highly adaptable plant, thriving in wet, dry, or salty ground, rooting readily from slips and pushing forth vigorously; hence it is suitable for planting on shores and embankments. In the northern United States, however, it dies

to the ground in severe winters. The stem and leaves contain much sulphate of soda. A variety produces *Jews' tamarisk manna*. (See *manna*.) *T. articulata* (*T. orientalis*) is the chief source of tamarisk-galls, which are said to contain 50 per cent. of tannin, and are used in dyeing and medicine. It is found in northwest India and westward, and is sometimes distinguished as *tamarisk salt-tree*, from its secreting salt which incrusts its trunk in sufficient quantity for some culinary use. It is a bush or tree of coniferous aspect. *T. dioica* of India, etc., yields a pale-yellow soluble resin.

It is distinguished by its free or slightly united stamens, and ovary usually with three or four short styles. About 60 species have been described, now reduced to about 25, natives of the Mediterranean region and central and tropical Asia, chiefly of salt-marshes of the sea-coast; a few occur in South Africa. They are shrubs, sometimes arborescent, bearing minute scale-like clasping or sheathing leaves. They are confined to America, and almost entirely to the Neotropical region, only one genus (*Piranga*) having any extensive dispersion in North America. They are small birds, the largest scarcely exceeding a thrush in size, and the average length being about 6 inches. They are remarkable even among tropical birds for the brilliancy and variety of the plumage, in

one or both sexes. The *Tanagræ* are closely related to the finches (*Fringillidæ*), and some of them have the bill as stout as that of a bullfinch; in other cases the bill is slender and acute, approaching that of the American warblers and gnatcatchers (*Mniotiltidæ* and *Corvidæ*). In some instances the bill is strongly notched, and even toothed. The family has never been satisfactorily defined, and is probably insusceptible of exact technical delimitation. It includes several hundred species, of numerous genera. It is divided by Selater into *Procinthinae*, *Euphoniae*, *Tanagrae*, *Lamproline*, *Phoenicophilinae*, and *Pituhinae*. — **Stationary tangent plane of a surface.** See *stationary*. Tangent plane, a plane which touches a curved surface, as a sphere, cylinder, etc.

**II. n. 1. In geom.:** (a) A straight line through two consecutive points (which see, under *consecutive*) of a curve or surface. If we take the line through any two points of the locus, and then, while one of these points remains fixed, consider the other as brought by a continuous and not infinitely protracted motion along the locus into coincidence with the former, the line in its final position will be a tangent at that point. The idea of time which appears in this definition is only so far essential that some parameter must be used in order to define a tangent at a singular point, and this parameter must be such as to present no discontinuity or point-singularity at that point. A tangent at an ordinary point of a curve or surface may be defined, without the use of any parameter, simply as a line through two points infinitely close together. Although, if the doctrine of limits is used to explain away the idea of infinity, a parameter will be used for that purpose. A curve has only one tangent at an ordinary point, or a mere line-singularity, or a cusp, but

strings, and produce tones. Its action was not like that of the pianoforte-hammer, since it remained in contact with the string, and fixed the pitch of the tone by the place where it struck. If pressed too hard, it raised the pitch by increasing the string's tension. Accordingly the tone of the clavier was necessarily weak. — **Artificial tangents.** See *artificial*. Tangent.—The equation of the curve is  $y^2 = (1-x)^2x^3$ . a, binary tangent; b, nodal tangent; c, cuspidal tangent; d, inflectional tangent.

has two or more tangents at a node. A surface has a single infinity of tangents lying in one plane at an ordinary point; and two of these (real or imaginary), called the *inflectional tangents*, pass through three or more consecutive points of the surface. On the nodal curve of a surface the tangents lie in two or more tangent planes; at a conical point they are generators of a quadric cone. The tangents of a curve in space form two sets which are all generators of one developable. There are points upon some curves and surfaces at which, according to the doctrine of limits, there are no tangents. Such is the point in the second figure where the two multiple tangents intersect; for, as a second point on the curve moves toward this, the line through the two points will oscillate faster and faster, without tending toward any limit. In the same sense, a curve may have no tangent at any point; it may be an undulating line with small undulations on the large ones, and still smaller on these, and so on *ad infinitum*, the lengths and amplitudes of the undulations being duly proportioned. But an intelligence situated on such a curve might see that the tangent had a definite direction, for there is no logical absurdity in this. It is antagonistic to the principle of duality which rules modern geometry to define the tangent of a plane curve as the line through two consecutive points on the curve. On the contrary, the definition of a plane curve is a locus described by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point; and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive ineffectual points, or as the line of intersection of two consecutive tangent planes. The tangent plane of a spacious curve is a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. Euclid's definition of a tangent ("Elements," bk. III, def. 2) as a line meeting a circle and not crossing it when produced does not extend to curves having inflections. The definition of the tangent as the limiting case of a secant, which is due to Descartes (but was perfected by Isaac Barrow, 1674), may well be considered as the foundation of modern mathematics. scribed by the parametric motion of a line with a point upon it, the point slipping along the line and the line turning about the point; and such a generating line is a tangent. In like manner, a surface is the locus formed by a plane with a point upon it, the position of the point in the surface and the aspect of the surface about the point varying, the one and the other, according to the variations of the same pair of independent parameters. Such a plane is a tangent plane, and a tangent may equally be conceived as the line through two consecutive ineffectual points, or as the line of intersection of two consecutive tangent planes. The tangent plane of a spacious curve is a line lying in a plane and having a point upon it, the plane turning continuously about the line, the point moving along the line, and the line turning in the plane around the point as a center. According to this custom the right of succession was not in the individual, but in the family to which he belonged — that is, succession was hereditary in the family, but elective in the individual. The primitive intention seems to have been that the inheritance should descend to the oldest or the most worthy of the blood and name of the deceased. This was in reality giving it to the strongest, and the practice often occasioned bloody wars in families.

I have already called it *Tanistry*, the system under which the grown men of the tribe elect their own chief, generally choosing a successor before the ruling chief dies, and almost invariably electing his brother or nearest mature male relative. *Maine, Early Law and Custom*, p. 145.

It precipitates starch, albumin, and gluten, and forms with gelatin a very insoluble compound which is the basis of leather, and on which the art of tanning is founded. The word *tannin* has been loosely applied to all astringent vegetable principles. Commercially, tannic acid is of two kinds—*gallotannic acid*, derived from nutgalls, and *quercitannic acid*, which occurs in healthy leaves and bark. Gallotannic acid is the kind chiefly used. **tanning** (tan'ing), *n.* [Verbal *n.* of *tan*, *v.*]

1. The art or process of converting hides and skins into leather; the manufacture of leather. The process is chiefly chemical, and depends essentially upon the action of tannic acid, gallic acid, alum, sulphates of iron and copper, salt, and other agents on the gelatin, glutin, albumin, and other constituents of animal skins. Strictly, tanning is the treatment of hides with tannin, or tannic acid: the treatment of hides with alum and other minerals is called *tawing* (which see). In tanning proper, raw, salted, and dried hides of cattle are treated with some form of tannin, either by itself or in connection with other agents, and the product is called *leather* to distinguish it from the *white* or *alum leather*, *kid*, *lambskin*, etc. produced from the skins of goats, sheep, and other small animals. While a great number of plants yield tannin, the chief source of it is the bark of the oak, hemlock, birch, and beech, and the powdered leaves and young shoots of the sumac. Nutgalls are also used, as they carry gallic acid with the tannic acid. Many other vegetable matters are also used. The treatment of the hides in tanning is essentially a steeping or soaking in baths formed of extracts of tannin either by placing the ground bark directly in the baths, or by employing fluid extracts of the barks or sumacs. The hides are first freed from hair and fleshed, and are then placed in the baths. The art of tanning also includes the mechanical and chemical treatment of the hides to make them supple and water-proof. See *leather*, 1.

2. An appearance or hue of a brown color produced on the skin by the action of the sun.

Diseases and distempers incident to our faces are industriously to be cured without any thought or blame of pride: as bluishness, redness, inflammations, pimples, freckles, ruggedness, *tanning*, and the like.

**tan-ooze** (tan'öz), *n.* In *tanning*, an aqueous extract of tan-bark, as hemlock- or oak-bark or mixtures of these barks, or of other vegetable substances or mixtures of such substances with one another or with tan-bark, used in tanning. The ooze also usually contains in a suspended state the material or mixture of materials from which the water dissolves out the tannin in making the extract; and, after the more or less prolonged immersion therein of the hides or skins, the latter absorb a large proportion of the extracted tannin, and the ooze becomes somewhat shiny from animal matters. Also called *tan-liquor*.

A perennial herb, *Tanacetum vulgare*, a stout erect plant 2 or 3 feet high, with pinnate cut-toothed leaves, and yellow rayless heads in a terminal corymb. It is native in the northern Old World, and well known as an introduced roadside weed in North America. The acrid strong-scented leaves and tops are an official drug with the properties of an aromatic bitter and an irritant narcotic. The volatile oil is highly poisonous. The leaves were formerly used as a seasoning. See *def. 3*.*

A pudding or cake made with eggs, cream, sugar, rose-water, and the juice of tansy, to which that of spinach, sorrel, or other herbs was sometimes added.

*Strype, in Ellis's Lit. Letters, p. 178.*

The custom of eating *tansy* pudding and *tansy* cake at Easter is of very ancient origin, and was no doubt to be traced to the Jewish custom of eating cakes made with bitter herbs (Numbers ix. 11); but, to take from it any Jewish character, at a very early date it became the custom to eat pork or bacon with the cakes.

As prepared by electrolysis but not entirely pure, it appeared as a black powder, which assumed a grayish me-

talic luster under the burnisher, and which when gently heated took fire, and burned to an oxid. It was discovered by Ekeberg, in 1802, in the mineral afterward named by him *ytrotantalite*, and it has since been found in various rare minerals, as tantalite, columbite, pyrochlore, fergusonite, etc., in which it is almost always associated with niobium. It also occurs in small quantities in various tin, tungsten, and uranium ores. In its chemical relations it is allied to bismuth, antimony, and niobium.

It is known in Arizona and southern California as the *Colorado turkey* (or *water-turkey*), from the Colorado river. (See *wood-ibis*.) The name has been erroneously applied to several different ibises which belong to another family—a misnomer due in part to an old error which identified *T. ibis* with the Egyptian ibis, *Ibis religiosa*.

**Tantalus cup.** A philosophical toy, consisting of a siphon so adapted to a cup that, the short leg being in the cup, the long leg may go down through the bottom of it. The siphon is concealed within the figure of a man, whose chin is on a level with the bend of the siphon. Hence, as soon as the water rises up to the chin of the image it begins to subside, so that the figure is in the position of *Tantalus*, who in the fable (see *tantalize*) is unable to quench his thirst.

**tapeworm** (tap'wêrm), n. An entozoic parasitic worm, of flattened or tape-like form and indeterminate length, consisting of many separable joints, found in the adult state in the alimentary canal of most vertebrate animals. Such worms belong to the order *Cestodea* or *Teniada*, family *Teniidae*, and several different genera, especially *Tenia*, the true tapeworms, and *Bothriocephalus*, the broad tapes. The so-called "head" of a tapeworm, small and inconspicuous in comparison with the great length to which the body may attain, is the whole of the real worm, all the rest of the joints being merely successive generative buds, which contain the matured sexual elements, and are technically called *proglottides*. They are continually budded off from the head, the oldest joint being the one furthest from the head; and any number of them may be broken off and expelled from the body without stopping their continual gemination. This is why no tapeworm can be eradicated unless the head is expelled from the host. The chain of links or joints is the strobila; it may consist of several hundred generative buds, and grow to be several yards long. These formidable parasites are parenchymatous, having no mouth nor alimentary canal, and live by absorbing nourishment from that intended to nourish the host, so that persons thus parasitized may suffer from defective nutrition while acquiring a ravenous appetite. The head of the tape is provided with hooks or suckers, or both, for adhering to the mucous membrane of the host. The ova, matured in every one of the joints, do not complete their development in the animal in which the adult exists. They require to be swallowed by some other vertebrate, the ripe proglottides being expelled from the bowel of the host with all their contained ova fertilized. The segments or proglottides decompose and liberate the ova, which are covered with a capsule. After being swallowed the capsule bursts, and an embryo, called a *proscotex*, is liberated. This embryo, by means of spines, perforates the tissues of some contiguous organ, or of a blood-vessel. In the latter case being carried by the blood to some solid part of the body, as the liver or brain, where it surrounds itself with a cyst, and develops a vesicle containing a fluid. It is now called a *scolex* or *hydroid*, and was formerly known as the *cystic worm*. The scolex is incapable of further development till swallowed and received a second time into the alimentary canal of a vertebrate. Here it becomes the head of the true tapeworm (see *Tenia* head), from which proglottides are developed posteriorly by gemination, and the adult animal with which the cycle began is thus reached. (See cut under *Tenia*.) At least eight tapeworms, mostly of the genus *Tenia*, are found in man. The pork tape is *T. solium*, which in its cystic form (the so-called *Cysticercus cellulosus*) in the pig produces the disease measles (see *measles*, 2); it is acquired by those who eat

A dog-tapeworm, *T. varicosa*; its larva is called *Cysticercus*, and is the parasite of the rabbit. Another dog-tapeworm, *T. canis*, whose larva is the cystic worm *Cysticercus*, is the parasite of the sheep's brain, producing the gid or staggers. A third dog-tapeworm is *T. echinococcus*, whose larva, known as *Echinococcus* *intermedium*, is a common hydatid cyst, sometimes found in man. *T. marginata* of the dog is the tapeworm from the slender hydatid *Cysticercus tenuicollis* of the sheep. A cysticercus of the mouse becomes *Tenia crassidolia* in the cat. Certain cysticerci of moles become in the fox *Tenia tenuicollis* and *T. crassiceps*. The broad tapeworm of man is *Bothriocephalus latius*, also called *Sinus tapeworm*, and another human parasite of this genus is *B. cordatus*. Tapes are also called ribbon-worms. (b) In the puddling-furnace, a small hole through which the slag, technically termed *tap-cinder*, is let out, and which during the process of puddling is stopped with sand. See diagram under *puddling-furnace*. (c) In a cementation-furnace, a small hole in one end of each pot, opposite to which is a hole in the furnace-wall, used for the insertion of "trial" or "tap" bars, so placed as to be accessible for ready withdrawal and inspection during the cementation process. A conical cavity is dug in the side of a bank or a steep hill, and a cast-iron pan is placed at the bottom, from which leads a spout into a barrel for collecting the tar. Billets of wood (such as pine or fir) are thrown into this cavity, and, being covered with turf, are slowly burned without flame. The wood chiefly used in Europe is that of the Scotch pine, *Pinus sylvestris*, and the Siberian larch, *Larix Sibirica*; in the United States that of the long-leaved pine, *Pinus palustris*. Most of the tar produced in the United States is made in North Carolina, Virginia, and Georgia. In England wood-tar is chiefly obtained as a by-product in the destructive distillation of wood for the manufacture of wood-vin-gar (pyroligneous acid) and wood-spirit (methyl alcohol). It has an acid reaction, and contains various liquid matters, of which the principal are methyl-acetate, acetone, hydrocarbons of the benzene series, and a number of oxidized compounds, as carbolic acid. Paraffin, anthracene, naphthalene, chrysene, etc., are found among its solid products. It possesses valuable antiseptic properties, owing to the creosote it contains, and is used extensively for coating and preserving timber and iron in exposed situations, and for impregnating ships' ropes and cordage. Coal-tar is extensively obtained in the process of gas-manufacture. It is a very valuable substance, the compounds obtained from it forming the basis of many chemical manufactures. See *coal-tar*.

Modern targets for long-range practice with the rifle are made of metal, and the compartments are usually square, one within the other; the target for practice with cannon is generally intended to test the penetrating power of the projectile, and is accordingly built up in imitation of the side of a ship, or of a turret.

It was one of the series of "war measures" occasioned by the civil war of 1861–5, which resulted in a great development of the protective principle.—**Revenue tariff**, a tariff which has for its main object the production of revenue, as distinguished from a tariff which seeks to combine the production of revenue with protection to home industries. [U. S.]

**Tariff of abominations**, in U. S. hist., a name given to the tariff of 1828, in which the protective tendencies as displayed in the tariffs of 1816 and 1824 were strongly developed. It occasioned great opposition in the South, and led to the nullification movement.—**Tariff reform**, removal of inequalities or abuses in a tariff system. Specifically, in recent American politics, a reform favoring a general reduction of import duties, especially on raw materials and in general a movement away from protection.

—**Walker tariff**, in U. S. hist., a tariff established by an act passed in 1846, in accordance with principles laid down by Robert J. Walker, Secretary of the Treasury. It classified all articles under eight schedules, and greatly reduced the duties from the tariff of 1842. Its rates were still further reduced by the act of 1857.—**Wilson tariff** (from William L. Wilson, chairman of the Ways and Means Committee), the tariff established by the act of 1894. It made the average rate of duties somewhat lower than that which resulted from the McKinley tariff. The most important provision of the act was the free importation of raw wool. It became a law without the signature of President Cleveland.

**tariff** (tär'if), *v. t.* [*< tariff, n.*] 1. To make a list of duties on, as on imported goods.—2. To put a valuation upon.

Dryden, *Abd. and Achit.*, I. 249.

**tarnish** (tär'nish), *n.* [*< tarnish, v.*] 1. A spot; a blot; the condition of being dulled or stained.—2. In *mineral*, the change in luster or color of the surface of a mineral, particularly one of

metallic luster: usually due to slight alteration, but also in some cases to the deposition of a very thin film of some foreign substance. Thus, a freshly fractured surface of boron soon gains a tarnish on exposure, becoming a bright purple color: it is hence often called *crystallized or purple copper ore*; so also columbite crystals often show a brilliant steel-blue tarnish.

**taro**<sup>1</sup> (tär'ō), *n.* [Also *taru*; *< Polynesian taro.*]

A food-plant, *Colocasia antiquorum*, especially the variety *esculenta*, a native of India, but widely cultivated in the warmer parts of the globe, particularly in the Pacific islands. It is a stemless plant with the general habit of the caladiums of house and garden culture. The leaves are heart-shaped and about a foot long. Its chief value lies in its stem-like tuberous starchy root, which is eaten boiled or baked, made into a bread or pudding, or in the Sandwich Islands, where it is the staple food of the natives, in the form of poi (which see). The tubers, when baked, pounded, and pressed, keep fresh many months. An excellent starch can be had from them. The leaves and leafstalks are also edible, with the character of spinach or asparagus. All parts of the plant are acrid, but this quality is removed by cooking. Taro is propagated by a cutting from the top of the tuber, which, in the Fiji Islands at least, is planted as soon as the crop is gathered. About fifteen months are required to mature the root. See *Colocasia* (with cut), also *cocco*, *eddoes*, and *tanya*.

We had ample opportunity to observe the native ways of living, . . . an uninteresting mess of stewed fowl and taro. Lady Brassey, Voyage of Sunbeam, II. xv.

One of a pack of playing-cards first used in Italy in the fourteenth century, and so named from the design of plain or dotted lines crossing diagonally on the back of the cards. The original pack contained seventy-eight cards—namely, four suits of ten numeral cards, as in the modern game, with four coat-cards (king, queen, chevalier, and valet) in each suit, and a series of twenty-two *atutti* or *atouts*, these last being the trumps, and known specifically as the *tarots*.

*Tarots*, a kind of great cards, whereon many several things are figured; which make them much more intricate than ordinary ones. Cotgrave.

**tarpan** (tär'pan), *n.* [Tatar name.] The wild horse of Tatar, belonging to one of those races which are by some authorities regarded as original, and not descended from domestic animals. Tarpans are not larger than an ordinary mule, are migratory, and have a tolerably acute sense of smell. Their color is invariably tan or mouse, with black mane and tail. During the cold season their hair is long and soft, lying so close as to feel like a bear's fur, and then it is grizzled; in summer it falls much away, leaving only a quantity on the back and loins. They are sometimes captured by the Tatars, but are reduced to subjection with great difficulty.

**tarpaulin** (tär-pä'lin), *n.* [Formerly also *tar-pawlin*; a reduction in sailors' speech of *tar-pauling*, *tar-pawling*, prop. *\*tar-palling*, *< tar* + *palling*, *pauling*, a covering, verbal *n.* of *pall*, *v.* Hence, by abbreviation, *tar*<sup>3</sup>.] 1. It was so named, according to tradition, from *Tarpeia*, daughter of the governor of a citadel at Rome, who betrayed the fortress to the Sabine soldiers, and was crushed to death under their shields and buried at the base of the rock.

Bear him to the rock *Tarpeian*, and from thence  
Into destruction cast him. Shak., Cor., III. 1. 213.

**tarpon** (tär'pon), *n.* [Also *tarpum*; origin not ascertained.] A large game-fish of the family *Elopidæ* and subfamily *Megalopinae* (which see), specifically *Megalops atlanticus*, also called *jer-fish*. This is one of the so-called big-eyed herrings, and a near relative of *Elops saurus*; but the pseudobranchiae are obsolete, the dorsal fin has a long filament, and the

Tarpon (*Megalops atlanticus*)

scales are very large. The form is elongate and compressed; the color is brilliant-silvery, darker on the back; and the length attained is about 6 feet. This fish is common in the warmer waters of the Atlantic, as on the southern coast of the United States, where it is sometimes called *grande dentelle*, from the size of the scales, which are used in ornamental fancy work. Its technical synonym, *M. thalassoides*, is erroneous, being based on *Clupea thalassoides* of Bloch and Schneider, 1801, and that on Bronson's *Clupea cyprinoides*, which is the East Indian representative of this genus (*Megalops cyprinoides*), a distinct though very similar species to which the name *tarpon* or *tarpum* is extended by Jordan.

Right Tarsus of an Amphibian (*Salamandra*), showing nearly symmetrical disposition of the tarsal bones. *T*, tibia; *F*, fibula; *t*, tibiale; *f*, fibulare; *i*, intermedium; *c*, centrale; these are tarsal bones of the proximal series; 1-5, the five tarsalia, or distal tarsals, known as tarsale 1, tarsale 2, etc.; I-V, the corresponding five digits or phalanges.

rent anomaly is explained by the fact that the embryo has several tarsal elements, proximal ones of which become consolidated with the tibia as the condyles of the latter, and distal ones of which become similarly fused with the principal metatarsal bone. Hence, a bird's tibia is really a tarsometatarsus, and a bird's principal metatarsal bone is really a tarsometatarsus; and the ankle-joint, apparently between the tibia and the metatarsus, is really metatarsophalangeal as in the mammals. See cuts under *booted*, *carpal*, *distal*, *epipode*, *Epipode*, *foot*, *metatarsus*, *Plan-* *trichia* and *Plesiosaurus*.

**Hence—2.** In *descriptive ornith.*, the shank; the part of the leg (properly of the foot) of a bird which extends from the bases of the toes to the first joint above, the principal bone of this section consisting of three metatarsal bones fused together and with distal tarsal bones. See cuts under *booted*, *scutellate*, and *tarsometatarsus*.—**3.** In *cutan.*: (a) The foot; the terminal segment of any leg, next to and beyond the tibia, consisting of a variable number of joints, usually five, and ending sometimes in a pair of claws like pincers, or in a sucker-like pad, or otherwise. It normally consists of five joints, but some of these may be very small or entirely absent, and in a few insects there is only one joint. These modifications are much used in classification, especially of beetles (see *tarsal system*, under *tarsal*). The joints are distinguished by numbers, the first being that attached to the tibia (in bees sometimes called the *planta* or *palm*, and in flies the *metatarsus*). The last joint is generally terminated by two hooks or claws called *ungues*, with a little piece, the onychium, between them, which Huxley regards as a sixth joint. (See *unguis*.) The tarsi serve the same purposes as the feet of vertebrate animals. See cuts under *coxa*, *Erotylus*, *mole cricket*, *Pentamerus*, and *Tetramera*. (b) The last joint of a spider's leg, forming, with the preceding joint, or metatarsus, the foot.—**4.** The small plate of condensed connective tissue along the free border of the upper and lower eyelid. The reason given by Paracelsus, "because it produces oil, water, tincture, and salt, which burn the patient as *Tartarus* does," is evidently imagined; but the word was no doubt connected with *L. Tartarus* in some vague way. It is said to be of *Ar.* origin, but it could not come, except by very unusual corruption, from the *Ar.* word given as its source, viz. *Ar. (and Pers.) dard*, dregs, sediment, the *tartar* of wine, the mother of oil; cf. *Ar. dardiy*, *Pers. dardí*, dregs, sediment; *Ar. darad*, a shedding of the teeth, *darda*, a toothless woman—referring, according to Devic, to the *tartar* on teeth.] **1.** Impure acid potassium tartrate, also called *argal* or *argol*, deposited from wines completely fermented, and adhering to the sides of the casks in the form of a hard crust, varying from pale pink to dark red according as it has separated from white or red wines. This is cream of *tartar*, which is much used in dyeing, in cookery, and also in medicine as a laxative and diuretic. See *cream*. Desire of lucre . . . is, however, but the *tartar* that encrusts economy.

This acid has four modifications, all having the same chemical composition, but characterized chiefly by their differences of action upon a ray of polarized light—common or dextrorotatory, levorotatory, racemic or paratartrac, and optically inactive or mesotartaric acid. The first-named is the commercial article. It crystallizes in large rhombic prisms, transparent and colorless, and very soluble in water. It is inodorous, and very sour to the taste. Tartaric acid is dibasic; its salts are called *tartrates*, and have a most remarkable disposition to form double salts, such as Rochelle salts, double potassium sodium tartrate, tartar emetic, double potassium antimony tartrate, etc. Tartaric acid is found in the free state in grape-juice, tamarinds, and many fruits, but chiefly in the form of acid potassium tartrate. It is obtained commercially from this salt, called *argol*, which deposits in crusts from fermenting wines. The purified salt is called *cream of tartar*. Tartaric acid is largely used in dyeing and calico-printing, and also in medicine.

= **Syn.** 3. *Taste, Savor, Flavor, Snack.* *Taste* is the general word, so far as the sense of taste is concerned: as, the *taste* of an apple may be good, bad, strong, woody, earthy, etc. *Savor* and *flavor* may apply to the sense of taste or to that of smell. *Savor* in *taste* generally applies to food, but is otherwise rather indefinite: as, to detect a *savor* of garlic in soup. *Flavor* is generally good, but sometimes bad: it is often the predominating natural *taste*: as, the *flavor* of one variety of apple is more marked or more palatable than that of another. *Snack* is a slight *taste*, or, figuratively, a faint smell, generally the result of something not disagreeable added to the thing which is tasted or smelled: as, a *snack* of vanilla in ice-cream; a *snack* of salt in the sea-breeze.—6. *Taste, Sensibility.* *Taste* is active, deciding, choosing, changing, arranging, etc.; *sensibility* is passive, the power to feel, susceptibility of impression: as, in the beautiful—7. *Taste, Judgment.* As compared with *judgment*, *taste* always implies esthetic sensibility: a sense of the beautiful, and a power of choosing, arranging, etc., in accordance with its laws. *Judgment* is purely intellectual. A good *judgment* as to clothing decides as to quality, with reference to durability, warmth, and general economy; good *taste* as to clothing decides agreeably as to colors, shape, etc., with reference to appearance.

**taunt<sup>1</sup>** (tānt or tānt), *v. t.* [Early mod. E. also *taunte*, *taunte*, also (and still dial.) *tant*; according to Skeat, prob. < OF. *tanter*, var. of *tenter*, *tempter*, try, tempt, provoke (> ME. *tenten*, *tenten*, E. *tempt*), < L. *tentare*, try, tempt: see *tent<sup>2</sup>*, *tempt*, of which *taunt* is thus a differentiated form. Skeat also quotes a passage from Udall, tr. of "Erasmus's Apophthegms," Diogenes, § 68, "Geuyng vnto the same *taunt pour taunte*, or one for another," suggesting an origin in the F. phrase *tant pour tant*, 'so much for so much': see *tantity*. There is no evidence that the sense was affected by OF. *tanser*, *tancer*, *tenser*, F. *tancer*, check, scold, reprove, *taunt*, < ML. as if \**tentiare*, from the same source as *tentare*.] 1. Originally, to tease; rally; later, to tease spitefully; reproach or upbraid with severe or insulting words, or by casting something in one's teeth; twit scornfully or insultingly.

Sometime *taunting* w/oute displeure, not w/oute disport.

Heywood, Hierarchy of Angels, p. 10.

=**Syn. 1.** *Ridicule*, *Chaff*, *Deride*, *Mock*, *Upbraid*, *Taunt*, *Flout*, *Twit*. We may *ridicule* or *chaff* from mere sportive-ness; we may *ridicule* or *upbraid* with a reformatory purpose; the other words represent, and all may represent, an act that is unkind. All except *mock* imply the use of words. As to *ridicule*, see *ludicrous*, and *banter*, *v.* and *n.* *Chaff*, which is still somewhat colloquial, means to make fun of or tease, kindly or unkindly, by light, ironical, or satirical remarks or questions. *Deride* expresses a hard and contemptuous feeling: "derision is ill-humored and scornful; it is anger wearing the mask of *ridicule*" (C. J. Smith, Syn. Disc., p. 667). It is not always so severe as this quotation makes it. *Mock* in its strongest sense expresses the next degree beyond *derision*, but with less pretense of mirth (see *imitate*). We *upbraid* a person in the hope of making him feel his guilt and mend his ways, or for the relief that our feelings find in expression; the word is one degree weaker than *taunt*. To *taunt* is to press upon a person certain facts or accusations of a reproachful character unsparingly, for the purpose of annoying or shaming, and glorying in the effect of the insulting words: as, to *taunt* one with his failure. To *flout*, or *flout at*, is to *mock* or insult with energy or abruptness; *flout* is the strongest of these words. To *twit* is to *taunt* over small matters, or in a small way; *twit* bears the relation of a diminutive to *taunt*.

**taunt<sup>1</sup>** (tānt or tānt), *n.* [Also dial. *tant*; < *taunt<sup>1</sup>*, *v.*] 1. Upbraiding words; bitter or sarcastic reproach; insulting invective.

A disagreeable or burdensome duty or charge; an exaction; a requisition; an oppressive demand; strain; burden; task.—2. An enforced proportional contribution levied on persons, property, or income, either (a) by the authority of the state for the support of the government, and for all its public or governmental needs, or (b) by local authority, for general municipal purposes. In a more general sense the word includes assessments on specific properties benefited by a local improvement, for the purpose of paying expenses of that improvement. Taxes, in the stricter sense, are *direct* when demanded from the very persons who it is supposed as a general thing will bear their burden: as, for example, poll-taxes, land or property taxes, income taxes, taxes for keeping man-servants, carriages, or dogs. Taxes are said to be *indirect* when they are demanded from persons who it is supposed as a general thing will indemnify themselves at the expense of others—that is, when they are levied on commodities before they reach the consumer, and are paid by those upon whom they ultimately fall, not as taxes, but as part of the market price of the commodity (*Cooley*): as, for example, the taxes called *customs*, which are imposed on certain classes of imported goods, and those called *excise duties*, which are imposed on certain home manufactures and articles of inland production. In the United States all state and municipal taxes are direct, and are levied upon the assessed values of real and personal property, while the revenue required for general governmental purposes is derived from indirect taxes upon certain imports, and upon whisky, tobacco, etc. In the United Kingdom, the governmental revenues are derived from both direct and indirect sources—from taxes on income, stamps, dogs, etc., from imposts on a few imported articles of consumption, especially tea, spirits, tobacco, and wines, and from excise duties. House taxes, or taxes on rental, form the largest part of the local rev-

ences, municipal revenues being entirely raised from this source. See phrases below.

Since (bounteous Prince) on law and my Descent  
Thou doost impose no other tax nor Rent  
But one sole Precept, of most just condition

The ability of a country to pay taxes must always be proportioned, in a great degree, to the quantity of money in circulation, and to the celerity with which it circulates.

A. Hamilton, Federalist, No. 12.

Taxes are a portion of the produce of the land and labor of a country, placed at the disposal of the government.

Ricardo, Pol. Econ., viii.

**Capitation tax**, a poll tax.—**Collateral-inheritance tax**. See *collateral*. **Diffusion of taxes**. See *diffusion*.—**Income tax**. See *income*.—**Inheritance tax law**. See *inheritance*.—**Poll tax**. See *poll-tax*.—**Single tax**, in economics, taxation solely on land-value, to the exclusion of other taxation by the same state. According to the theory advocated in recent times by Henry George and others, this tax should supersede all others, and should fall only on valuable land, exclusive of the improvements on such land.

The single tax, in short, would call upon men to contribute to the public revenues not in proportion to what they produce or accumulate, but in proportion to the value of the natural opportunities they hold. It would compel them to pay just as much for holding land idle as for putting it to its fullest use.

Henry George, Single Tax Platform.

**Succession tax**. See *succession*.—**Tax commissioner**, in certain of the United States, an officer, generally one of a board, charged with the valuation of property and assessment of taxes thereon.—**Tax deed**, a deed by which the officer of the law undertakes to convey the title of a former owner of land, sold by the state or a municipality for unpaid taxes, to the purchaser at the tax-sale.—**Tax lease**, a lease used where, instead of selling the fee, the state sells a term of years in the land.—**Tonnage tax**, a tax on vessels, usually measured by the tonnage of the vessel, sometimes imposed as a fee for entering the port, irrespective of any service received, but as a compensation for the privilege of entering and anchoring; a kind of tax which the States are prohibited by the United States Constitution from imposing, as distinguished from pilotage, quarantine, and similar dues imposed with reference to a service rendered or tendered.—**Wheel tax**, a popular name for a tax upon carriages.—**Window tax**. See *window*.—**Syn. 2. Tax, Impost, Duty, Customs, Toll, Rates, Excise, Assessment, Tribute**. Tax is the general word for an amount demanded by government for its own purposes from those who are under its authority. *Imposts, duties, and customs* are levied upon imports or exports, but *impost* applies to any tax viewed as laid on. *Toll* and *rates* are certain local taxes; as, *toll* at a bridge, ferry, or plank-road; *church-rates* and *poor-rates* in England, *water-rates*. *Excise* is a precise word in England (see *def.*); its most frequent use is in connection with malt and spirituous liquors. *Assessment* is either (a) the valuation of property for the purpose of its taxation; (b) the imposing of the tax; or (c) a charge on specific real property of a share of the expense of a local improvement specially benefiting that property. *Tribute* views the tax as laid not for the public good, but arbitrarily for the benefit of the one levying it, especially a conqueror; as, "Millions for defense, but not one cent for tribute." Each of these words had its older, peculiar, or figurative uses. See definitions of the words, and also of *subsidy*.

The act of laying a tax, or of imposing taxes on the subjects or citizens of a state or government, or on the members of a corporation or company, by the proper authority; the raising of revenue required for public service by means of taxes; the system by which such a revenue is raised.

The subjects of every state ought to contribute to the support of the government, as nearly as possible in proportion to their respective abilities: that is, in proportion to the revenue which they respectively enjoy under the protection of the state. . . . In the observation or neglect of this maxim consists what is called the equality or inequality of taxation.

As constituted by Eichler, it includes 15 or 20 species of 5 genera, mostly of northern temperate regions. It is characterized by dioecious flowers, the pistillate in aments of imbricated scales, of which several or only the terminal one is fertile, and by a solitary erect or afterward oblique ovule which is surrounded or partly inclosed by the hollowed apex of a sessile or stalked lamina free from its accompanying bract. The genus *Ginkgo* is exceptional in bearing an ovule on each lobe of a two- to six-parted lamina, *Cephalotaxus* in its small adnate lamina with twin ovules, and *Phyllocladus* in its monocious flowers. Only one genus, *Taxus* (the type), is of wide distribution. *Cephalotaxus* and *Ginkgo* occur only in China and Japan; *Torreya* there and in the United States; *Phyllocladus* in Tasmania, New Zealand, and Borneo. The tribe *Taxæ* of Benth and Hooker (1880) differs in excluding *Cephalotaxus* and including two chiefly Australian genera, *Dacrydium* and *Phoraphora*, now united and placed in *Taxoidæ*.

It consists in the apposition of individual bones of one tarsal row with those of the other row, and is distinguished from the *diplarthrous* arrangement prevailing in the true ungulates. In a perfectly taxeopod foot each of the distal tarsal bones would articulate by its whole proximal surface with the distal surface of one bone of the proximal row. In the *diplarthrous* type each bone of one row has more or less extensive articulation with two bones of the other row.

*II. n.* A member of the *Taxeopoda*. **Taxeopoda** (tak'sē-op'ō-dā), *n. pl.* [NL.: see *taxeopod*.] A prime division of ungulate or hoofed quadrupeds, consisting of the fossil *Con-*

(Waterhouse, 1838), < NL. *taxus*, a badger, + Gr. *είδος*, form.] A genus of *Mustelidae*, of the subfamily *Melinae*, which contains the American badger, *T. americana*. It differs from *Meles* and other meline genera in many important cranial and dental characters, as well as in external form. The teeth are 34, with only 1 true molar above and 2 below on each side. See *stuffing*, 3.

**taxin** (tak'sin), *n.* [*Gr. taxis* + *-in*.] A resinous substance obtained in small quantity from the leaves of the yew-tree, *Taxus baccata*, by treatment with alcohol and tartaric acid.

**Taxodiæ** (tak-sō-di'ē-ē), *n. pl.* [NL. (Parlatore, 1864), *< Taxodium + -æ*.] The name used by De Candolle for a tribe of conifers, nearly the same as the subtribe now known as *Taxodineæ*. Bentham and Hooker (1880), retaining the name *Taxodiæ*, altered the tribe by excluding the genera *Cunninghamia* and *Sciadopitys* and by including *Cephalotaxus*; and in this form the tribe coincides with the *Taxodineæ* of Goebel (1882), except that the latter excludes *Cephalotaxus*.

**Taxodinæ** (tak-sō-di'nē), *n. pl.* [NL. (A. W. Eichler, 1887), *< Taxodium + -inæ*.] A subtribe of conifers, classed under the tribe *Abietineæ*, and including 12 species, belonging to 7 genera, differing widely both in characters and in locality, some of them among the most remarkable of all known trees. Several inhabit Japan or China or both, as *Glyptostrobus*, including two small species, and *Sciadopitys*, *Cunninghamia*, and *Cryptomeria*, all monotypic genera of lofty trees. A second group, of three species of small or middle-sized trees, the genus *Athrotaxis*, occurs in Tasmania and Victoria. The remaining or North American group consists of the two genera *Taxodium* and *Sequoia*, each of two species, all attaining either an immense height or girth or both. See *Taxodium* (the type), also *Sequoia*, *Sciadopitys*, and *Cunninghamia*. Compare *Taxodiæ*.

**Taxodium** (tak-sō-di'um), *n.* [NL. (L. C. Richard, 1810), *< Gr. τάξις*, yew, + *είδος*, form.] A genus of coniferous trees, of the tribe *Abietineæ*, type of the subtribe *Taxodinæ*. It is characterized by a globose or obovoid cone composed of scales with an entire margin, at the apex woody, dilated, and truncate, on the back unbonate or mucronate, and including the two irregularly three-angled seeds, which contain six to nine cotyledons. There are two species, natives of the United States and Mexico. They are loosely branched trees, bearing alternate, somewhat spirally set leaves, linear and spreading in two ranks, or small, appressed, and scale-like on the flowering branches. The slender leaf-bearing branches resemble pinnate leaves, and fall off in autumn like the leaves of the larch. The flowers are monocious, both sexes on the same branches, the staminate forming drooping spiced panicles, while the female form sessile globose aments scattered singly or in pairs, and

closely crowded with spirally set scales. The fruit is a hard round cone, an inch long, with its very thick scaly pericarp stalked stalks gaping apart at maturity, but persistent after the fall of the seeds, which are large, shining, and concave or corky on the surface. *T. distichum*, the bald or red cypress of the United States, is characteristic of southern swamps near the sea-coast, occupying large tracts to the exclusion of other trees, and extending often into deep water around lake-margins. It occurs from Delaware to Texas, and also in the Mississippi and Ohio valleys to Indiana and Illinois. It often reaches a great size, sometimes 150 feet in height and 36 in girth, and furnishes a valuable wood which is soft, close, easily worked or split, and very durable, and is much employed for coopers, railway-ties, fences, posts, and shingles. It is almost indestructible in water or in contact with earth, but is often injured, especially beyond the Mississippi, by a fungus, a species of *Dredalea*. Two varieties are distinguished by lumbermen—the white cypress, with light-brown wood, and the black cypress, with dark-brown harder and more durable wood, at first heavier than water; the sap-wood of both is nearly white. The tree is also the source of an essential oil, a superior turpentine, and a medicinal resin, and from the beauty of its feathery foliage it is valued for lawn cultivation. It is especially remarkable for its habit, when growing under water, of throwing up large smooth conical projections known as *cypress-knees*, commonly 2 (sometimes 7) feet high, covered with reddish bark like the roots, and hollow, as is the base of the tree itself. They are by some supposed to be aerating organs, by others to serve as braces to afford a stable lateral support in the yielding bottom, and by others to be undeveloped or arrested tree-trunks. (Compare *cypress-knee*, *knee*, 3(d), and *cypress*.) The tree itself often rises out of water as a straight gray shaft 80 or 90 feet high before dividing into its flat spreading top, its base ribbed by large projecting buttresses, each continuous below with a strong and branching root, from horizontal branches of which the knees arise. The tree is also remarkable for its great longevity, growing rapidly at first, in cultivation sometimes adding an inch in diameter a year, but soon becoming as slow-growing as the yew, and adding only an inch in twelve to thirty years. The other species, *T. mucronatum*, the Mexican cypress, or ahuehuate, forms extensive forests in the Sierra Madre, at elevations from 4,000 to 9,000 feet, itself often reaching 70 to 100 feet high, with longer and pendulous branchlets and more persistent greener leaves. It attains even a greater size and age than *T. distichum*; the celebrated cypress of Montezuma, in the gardens of Chapultepec, variously estimated from 700 to 2,000 years old, is 41 to 45 feet in girth and about 120 feet high; one at Atlixco is about 76 feet, and another, near Oaxaca, 112 feet in girth; the latter was estimated by A. de Candolle and Asa Gray to be at least 4,000 years old. A third species, *T. heterophyllum* (for which see *water-pine*, under *pine*), is now separated as *Glyptostrobus heterophyllum*, on account of its obovoid cone and stalked seeds. The genus is of great antiquity geologically, being found in the Cretaceous and in great abundance in the Tertiary of nearly all parts of the world.

**Taxodiæ** (tak-soi'dē-ē), *n. pl.* [NL. (A. W. Eichler, 1887), *< Taxus + Gr. είδος*, form, + *-æ*.]

1. A tribe of conifers, of the suborder *Taxaceæ* (the suborder *Taxodiæ* of Eichler), distinguished from *Taxææ*, the other tribe within that suborder, by the absence of any bracteoles around the ovules. It includes about 54 species, of 4 genera, two of which are monotypic, *Saxe-gothæa*, a small yew-like tree of Patagonia, and *Microcachrys*, a prostrate shrub of Tasmania. For the others, see *Podocarpus* and *Dacrydium*. The tribe as now received coincides with the *Podocarpeæ* of previous authors with the addition of *Dacrydium*.

If . . . the student will attend to the facts which constitute the subject-matter of classifications, rather than to the modes of generalizing them which are expressed in *taxonomic* systems, he will find that, however divergent these systems may be, they have a great deal in common. *Huxley, Anat. Invert.*, p. 561.

**taxonomical** (tak-sō-nom'ik-al), *a.* [*< taxonomic + -al*.] Same as *taxonomic*. *Encyc. Brit.*, XXIV. 652.

Our knowledge of the anatomy, and especially of the development, of the Invertebrata is increasing with such prodigious rapidity that the views of *Taxonomists* in regard to the proper manner of expressing that knowledge by classification are undergoing, and for some time to come are likely to undergo, incessant modifications. *Huxley, Anat. Invert.*, p. 561.

**taxonomy** (tak-son'ō-mi), *n.* [*Prop. \*taxiomy*; *< F. taxonomic, taxinomic*, and *prop. taxionomie*; *< Gr. τάξις*, orderly arrangement, + *νόμος*, a law.] The laws and principles of taxology, or their application to the classifying of objects of natural history; that department of science which treats of classification; the practice of classifying according to certain principles.

**tax-sale** (taks'sāl), *n.* A sale of land by public authority for the non-payment of taxes assessed thereon.

**Taxus** (tak'sus), *n.* [NL. (Tournefort, 1700), *< L. taxus = Gr. τάξος*, a yew-tree.] A genus of conifers, the yews, type of the tribe *Taxææ* and suborder *Taxaceæ*. It is characterized by mostly dioecious flowers, the female solitary and consisting of a single erect ovule on a small annular disk, which soon becomes cup-shaped and fleshy, and finally forms a pulpy berry inclosing the seed, but free from it and open at the truncate apex. The small globular male flowers are solitary in the axils, surrounded by a few imbricated scales, with a short stalked stamen-column, five to eight roundish depressed and furrowed anthers, which become almost umbrella-shaped and four- to six-lobed after maturity, and bear three to eight cells connate into a ring. The ripened seed is hard, woody, and nut-like, somewhat viscid when fresh, and contains an embryo of two cotyledons. There are 6 or 8 species, by some considered all varieties of one, natives all of the northern hemisphere and widely dispersed. They are evergreen trees or shrubs, bearing short-petioled flat linear rigid leaves which are somewhat spirally inserted, but usually spread flatly into ranks. The genus is remarkable for the great variation within the same species, *T. baccata*, the yew, seldom exceeding 15 or 20 feet in height in England, but in the Himalayas becoming a naked trunk 30 feet high and often 16 in girth, its top reaching 70 or, it is said, sometimes 100 feet in height. *T. brevifolia* is similarly a low shrub in Montana, but a stately tree sometimes 75 feet high near the Pacific. *T. Canadensis*, the ground-hemlock, formerly regarded as a variety of the British species, usually a prostrate shrub, extends from New Jersey and Iowa northward, generally under evergreens. The other North American species, *T. Florida* of West Florida and *T. globosa* of Mexico, are small trees, as are those of Japan, where *T. cuspidata* is cultivated and many curious varieties have been produced. The genus is similar to *Taxodium* in its slow growth, and remarkable for the great bulk attained by older trees, as the celebrated Ankernyke yew near Staines, in England, within sight of which the Magna Charta was signed, which is 27½ feet in girth; the Tisbury yew in Wilts, 37 feet; and the Fortingall yew in Perthshire, 56½; the first of these was estimated by Asa Gray to be at least 1,100 years old, and the second 1,600. See *yew*, and compare *hemlock-spruce*.

flavored with the flowers of the fragrant olive (see *Osmantus*), of the chulan, and sometimes of the Cape jasmine (see *Gardenia*) and of other plants. This classification applies more especially to Chinese teas. Tea became known in Europe during the seventeenth century. Among western nations the greatest consumers of tea are Great Britain, Russia, and the United States.

2. The tea-plant, *Camellia theifera*, often named *Thea Sinensis* (or *Chinensis*). The tea-plant is a shrub from 3 to 6 feet high, with leaves from 4 to 8 inches

long and from 1½ to 2½ inches broad, and tapering toward both ends; the flowers are white, and about 1½ inches broad. The cultivated plant is of a more contracted habit, with smaller, more obtuse, and leathery leaves. The plant is known to grow wild in upper Assam, the form there found having sometimes been distinguished as *Thea Assamica*, forming, with its varieties, Assam tea. The Assam plant is much superior to the Chinese, and the teas most planted are hybrids of the two. The Chinese tea has two varieties, formerly distinguished as *Thea Bohea* and *T. viridis*, black and green tea; but either kind of tea can be made from either plant. China is the great seat of tea-culture; but tea is also extensively grown in Japan, having been

introduced in the reign of Saga Tennō (A. D. 810-23), also in India and Java. Promising experiments have been made in Madagascar, Natal, Jamaica, etc. In the United States it can be grown successfully in the South and in California; but the cost of labor has thus far prevented its economic success.

3. An infusion of the prepared leaves of the tea-plant, used as a beverage, in Great Britain and America commonly with the addition of a little milk or sugar, or both, in continental Europe often with a little spirit, in Russia with lemon, and in China and neighboring countries without any admixture. Its action is stimulating and invigorating, and, owing to the presence of tannin, more or less astringent. Its main quality depends upon the alkaloid therein; the leaf contains also volatile oils, which give it its fragrance, and some other substances. Excessive use, especially of green tea, affects the nervous system unfavorably. While tea contains but trifling nutriment, it is held to retard the waste of the tissues and diminish the need of food.

That excellent and by all physicians approved China drink called by the Chinese *Tcha*, and by other nations *tay*, alias *tee*, is sold at the Sultana Head Coffee House, London. *Mercurius Politicus*, Sept. 30, 1658.

opening, wink-tipping cordial, to whose glorious insipidi-

Tears consist of slightly saline water, having an alkaline reaction.

=*Syn.* 3. *Tease*, *Vex*, *Annoy*, *Molest*, *Badger*, *Pester*, *Bother*, *Worry*, *Plague*, *Torment*. All these words either may or must refer to repeated acts; they all suggest mental pain, but of degrees varying with the word or with the circumstances; all except *badger* and *molest* may be used reflexively, but with different degrees of appropriateness, *vex*, *worry*, and *torment* being the most common in such use; the agent may be a person, or, except with *badger*, it may be a creature, events, circumstances, etc.; it would be clearly figurative to use *tease* when the agent is not a person; all except *tease* are always used seriously. *Tease* is not a strong word, but has considerable breadth of use; a child may *tease* his mother for what he desires; there is a great deal of good-humored *teasing* of friends about their matrimonial intentions; a fly may *tease* a dog by continually waking him up. *Vex* is stronger, literally implying anger and figuratively applying to repeated attacks, etc., such as would produce an excitement as strong as anger. In Shakespeare's "still-vex'd Bermoothes" (*Tempest*, l. 2. 229), the use of *vex* is somewhat poetic or archaic, as is the application of the word to the continued agitation of the sea. *Annoy* has a middle degree of strength between *tease* and *vex*; a feeling of annoyance is somewhat short of vexation. We may be annoyed by the persistence of flies, beggars, duns, suitors, picket-firing, etc. *Molest* is generally a stronger word in its expression of harm done or intended, including the sense of disturbing once or often; some wild animals will not *molest* those who do not *molest* them. The next four words have a homely force—*badger* being founded upon the baiting of a badger by dogs, and thus implying persistence, energy, and some rudeness; *pester* implying similar persistence and much small vexation; *bother* implying weariness and perhaps confusion of the mind; and *worry* implying actual fatigue and even exhaustion. *Plague* and *torment* are very strong by the figurative extension of their primary meaning, although they are often used by hyperbole for that which is intolerable only by constant return: as, a tormenting fly. See *exasperate* and *harass*.

A name of various myrtaceous and other plants, chiefly of the genera *Leptospermum* and *Melaleuca*, found in Australia, Tasmania, and New Zealand. See phrases below. Very abundant and conspicuous, especially in New Zealand, is *L. scoparium*, the broom tea-tree, known also as *tea-scrub*. It is an erect rigid shrub, or in the mountains prostrate, from 1 to 12 feet high, forming dense thickets, with leathery sharp-pointed foliage, covered for two months with abundant small white blossoms. Its wood, though small, is hard and useful for turning, etc. *L. lanigerum*, the Tasmanian tea-tree (found also in Australia), is a somewhat larger, very abundant shrub or tree, with a hard even-grained wood. The leaves of both are reputed to have been used by Captain Cook or early colonists as tea, which may account for the name, but the native Australian name of the former is *ti*. *Melaleuca uncinata*, the common tea-tree, is a shrub, or sometimes a tree from 40 to 80 feet high, with hard, heavy, durable wood, widely diffused in Australia.

Even the grass itself is not indigenous, all these hills (in New Zealand) having till recently been densely clothed with a thicket of *tea-tree*, which is a shrub somewhat resembling Juniper or a gigantic heather-bush, its foliage consisting of tiny needles, while its delicate white blossoms resemble myrtle. It is called by the Maoris *manakau*, but the settlers have a tradition that Captain Cook and his men once made tea of its twigs; hence, they say, the name. It is, however, noteworthy that this plant is called *ti* by the Australian blacks, so it is probable that the name was brought thither by some colonist from the sister isle.

**tea-urn** (tē'ēr), *n.* A vessel used on the tea-table for boiling water or keeping water hot: it differs from the tea-kettle chiefly in having a faucet or cock instead of a spout, so that it has not to be moved or tipped for drawing hot water.
